† Complex attribute **feature name**, sub-attribute **name usage** is mandatory if the name is intended to be displayed when display of names is enabled by the boatmaster. See clause 2.5.8.

For each instance of **information**, at least one of the sub-attributes **file reference** or **text** must be populated.

### 12.2.1 Weed - Kelp

If it is required to encode marine weed or kelp, it must be done using the feature **Weed/Kelp**.

#### Remarks:

- For the boatmaster, the presence of kelp is also generally an indication of the presence of submerged rocks.

Distinction: Seabed Area; Seagrass; Vegetation.

#### Inland specific Encoding Instructions:

---

## 12.3 Seagrass

**IHO Definition: SEAGRASS.** Any of various submerged monocotyledonous plants (such as eelgrass, tape grass, and turtle grass) of tropical to temperate usually shallow coastal waters that have narrow grass-like leaves and often form dense underwater meadows. (Merriam-Webster on-line dictionary).

### **S-401 Geo Feature: Seagrass (WEDKLP) (O)**

#### **Primitives: Point, Surface**

| -                     | <b>Spatial Association</b> (see clause 25.10)   | <b>Spatial Quality</b>      | Association | 0,*          |

† Complex attribute **feature name**, sub-attribute **name usage** is mandatory if the name is intended to be displayed when display of names is enabled by the boatmaster. See clause 2.5.8.

For each instance of **information**, at least one of the sub-attributes **file reference** or **text** must be populated.

### 12.3.1 Seagrass

If it is required to encode seagrass, it must be done using the feature **Seagrass**.

#### Remarks:

- Many seagrass beds are subject to strict protection measures. Such measures must be encoded, where required, using the features **Restricted Area** (see clause 17.8).
- If considered necessary, the type of seagrass may be encoded using the complex attribute **information** (see clause 2.4.6).

Distinction: Seabed Area; Vegetation; Weed/Kelp.

#### Inland specific Encoding Instructions:

---

## 12.4 Sandwave

**IHO Definition: SANDWAVE.** Large mobile wave-like sediment feature in shallow water and composed of sand. The wavelength may reach 100 metres; the amplitude may be up to 20 metres. (IHO Dictionary – S-32).

### **S-401 Geo Feature: Sandwave (SNDWAV) (O)**

**Primitives:** Point, Curve, Surface

### Feature Associations

| S-401 Role         | Association Type                                | Associated to               | Type        | Multiplicity |
|--------------------|-------------------------------------------------|-----------------------------|-------------|--------------|
| The Updated Object | <b>Updated Information</b> (see clause 25.16)   | <b>Update Information</b>   | Association | 0,*          |
| -                  | <b>Additional Information</b> (see clause 25.1) | <b>Nautical Information</b> | Association | 0,*          |
| -                  | <b>Spatial Association</b> (see clause 25.10)   | <b>Spatial Quality</b>      | Association | 0,*          |

† For each instance of **information**, at least one of the sub-attributes **file reference** or **text** must be populated.

Complex attribute **feature name**, sub-attribute **name usage** is mandatory if the name is intended to be displayed when display of names is enabled by the boatmaster. See clause 2.5.8.

#### 12.4.1 Sandwaves

Sandwave areas may be dangerous to boatmasters, as the depth may be less than charted, because surveys are not necessarily conducted at the ideal time for sandwave building. Some research has shown that sandwave mobility is most evident in the vertical plane and high spots may occur on crest lines in response to calm weather, and possibly during particular times within the tidal cycle. It is therefore important to warn the boatmaster of the presence of sandwaves, and provide them with as much information as is available and can be included in the IENC.

If it is required to encode sandwaves, this must be done using the feature **Sandwave**.

#### Remarks:

- The shifting nature of the seabed resulting from sandwave activity should be indicated on the underlying **Quality of Bathymetric Data** (see clause 3.8), using the attribute **category of temporal variation**.

- The attribute **vertical length** is used to populate the amplitude of the sandwave above the seafloor, where known.
- Care must be taken not to over-generalize depth depiction in sandwave areas, as the typically convoluted contour pattern, and significant depth changes between soundings selected from crests and troughs, help to draw attention to these features. However, this will not usually be sufficient warning, as the variance between crest and trough may fall between standard contours, or the optimum display scale for the IENC data may be insufficient to show the sandwaves individually, or anything but the shoalest soundings. Attention should therefore be drawn to the area by encoding a **Sandwave** feature. If considered necessary, the nature of any navigational hazard presented by the sandwaves may be incorporated using the complex attribute **information** (see clause 2.4.6).
- Where frequently repeated surveys show variations in least depth, the shoalest soundings obtained over a period of years should be encoded. This blending of details from surveys of differing dates must be done with care; in particular, long-term deepening must not be overlooked.

Distinction: Seabed Area.

Inland specific Encoding Instructions:

---

## 13 Geo Features – Rocks, Wrecks, Foul Ground, Obstructions

Full details of all dangers to navigation must be encoded except in those areas for which the IENC is clearly inappropriate for navigation. The fullest possible information on clearance depths must be given irrespective of their depths, in preference to making any arbitrary distinction between “dangerous” and “non-dangerous” depths. This will allow boatmasters of all classes of vessels, including deep-draught ships and submarines, to make their own assessments of what is dangerous to them.

Due to possible Inland ECDIS or ECS display issues isolated dangers of type point (feature types **Underwater Rock**, **Wreck** and **Obstruction**) should be encoded as isolated nodes; that is, they should not be encoded on connected nodes. Similarly, isolated dangers should not be encoded on an edge of a **Depth Area**, **Dredged Area** or **Unsurveyed Area**; where this occurs the geometry of the Skin of the Earth features should be amended.

### 13.1 Danger line limiting an area of wrecks or obstructions

Figure 13-1 – Area of wrecks

### 13.2 Danger line bordering an area through which navigation is not safe

A danger line, bordering an area through which navigation is not safe, should be encoded using an **Obstruction** feature of type surface, with attribute **category of obstruction** = 6 (foul area).

### 13.3 Doubtful dangers

The fact that a danger is doubtful should be encoded using the feature attributes **quality of vertical measurement** and **status** and the spatial attribute **quality of horizontal measurement** for the feature:

|                      | quality of<br>horizontal<br>measurement | quality of<br>vertical<br>measurement | status |
|----------------------|-----------------------------------------|---------------------------------------|--------|
| Position approximate | 4                                       |                                       |        |
| Position doubtful    | 4                                       |                                       |        |
| Existence doubtful   |                                         |                                       | 18     |
| Doubtful sounding    |                                         | 3                                     |        |
| Reported danger      | 4                                       | 8 or 9                                |        |

**Table 13-1 – Doubtful dangers – Attribute encoding**

**Remarks:**

- The same notions of approximate or doubtful positions and doubtful existence also apply to features other than dangers (for example landmarks, buoys).

### 13.4 Underwater/awash rock

**IHO Definition:** **UNDERWATER/AWASH ROCK.** A concreted mass of stony material or coral which dries, is awash or is below the water surface. (S-57 Edition 3.1, Appendix A – Chapter 1, Page 1.194, November 2000).

**S-401 Geo Feature:** Underwater/Awash Rock (UWTROC, uwtrroc) (C)

**Primitives:** Point, Surface

† Complex attribute **feature name**, sub-attribute **name usage** is mandatory if the name is intended to be displayed when display of names is enabled by the boatmaster. See clause 2.5.8

For each instance of **information**, at least one of the sub-attributes **file reference** or **text** must be populated.

The Inland ECDIS or ECS "system" attribute **default clearance depth** must be populated with a value, which must not be an empty (null) value, if the attribute **value of sounding** is populated with an empty (null) value.

#### 13.4.1 Rocks which may cover

Full details of all dangers to navigation must be encoded except in those areas for which the IENC is clearly inappropriate for navigation. The fullest possible information on clearance depths must be given irrespective of their depths, where known, in preference to making any arbitrary distinction between "dangerous" and "non-dangerous" depths. This will allow boatmasters of all classes of vessels, including deep-draught ships and submarines, to make their own assessments of what is dangerous to them.

Underwater rocks may cover and uncover, may be awash, or may be always underwater.

Population of the attributes **quality of vertical measurement**, **water level effect**, **reported date** and the spatial attribute **quality of horizontal measurement** are described in the Table below:

| Rock or coral reef                 | water level effect | quality of vertical measurement    | Comment                                                                                                                                                                         |
|------------------------------------|--------------------|------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Covers and uncovers, depth unknown | 4                  | 2 or <undefined>                   | See Remarks below for population of the attribute <b>exposition of sounding</b> .                                                                                               |
| Covers and uncovers, depth known   | 4                  | any value except 2; or <undefined> | Negative value for <b>value of sounding</b>                                                                                                                                     |
| Awash                              | 5                  |                                    |                                                                                                                                                                                 |
| Always submerged, depth unknown    | 3                  | 2 or <undefined>                   | See Remarks below for population of the attribute <b>exposition of sounding</b> .                                                                                               |
| Always submerged, depth known      | 3                  | any value except 2; or <undefined> |                                                                                                                                                                                 |
| Reported, not confirmed            | 3,4 or 5           | 9                                  | If available, the year reported should be encoded in <b>reported date</b> .<br>The spatial attribute <b>quality of horizontal measurement</b> should be set to 4 (approximate). |

**Table 13-2 – Underwater rocks – Attribute encoding**

#### Remarks:

- For rocks which do not cover (islets), see clause 5.4.2.
- All **Underwater/Awash Rock** features should be encoded using one of the above combinations of attributes.
- The minimum depth, if known, over any submerged rock, must be encoded using the attribute **value of sounding**. Where **value of sounding** is populated with an empty (null) value, display of the rock in Inland ECDIS or ECS as an underwater hazard, in accordance with the boatmaster's selected safety depth, will be dependent on the value populated for the Inland

ECDIS or ECS “system” attribute **default clearance depth** (see clauses 2.4.5.1, 30.1 and 8<sup>th</sup> bullet below.)

- An instance of the information type **Spatial Quality** (see clause 24.5) may be associated to the rock point geometry, using the association **Spatial Association**, to indicate, where required, that the horizontal position and/or the vertical uncertainty for the rock is of different (higher or lower) accuracy than indicated by the underlying **Quality of Bathymetric Data** Meta feature (see clause 3.8). Where **Spatial Quality** is associated to the rock and **value of sounding** is populated with an empty (null) value, the value for the attribute **vertical uncertainty (uncertainty fixed)** on the associated **Spatial Quality**, where required, must also be populated as empty (null). See also clause 3.8.1.3 (Sounding uncertainty).
- Where **Underwater/Awash Rock** is encoded, there must be no **Sounding** feature encoded coincident.
- For surface rock and coral reef features, see clause 12.1.1.
- When a group of rocks is surrounded by a danger line, each rock should be encoded as a separate **Underwater/Awash Rock** feature covered by an obstruction area feature (**Obstruction** – see clause 13.6).
- If it is required to encode an **Underwater/Awash Rock** feature where the attribute **value of sounding** populated with an empty (null) value, but the source information indicates the depth of the feature is within the range of the surrounding depth area, the value **exposition of sounding** = 1 (within the range of the surrounding depth area) must be populated in order to avoid the unnecessary display of isolated danger symbols in Inland ECDIS or ECS.

Distinction: Obstruction; Seabed Area; Sounding; Wreck.

Inland specific Encoding Instructions:

- A drying height is indicated by a negative value within the attribute **value of sounding** (VALSOU). If this value is not known **value of sounding** (VALSOU)="unknown" shall be encoded.
- Rocks and groups of rocks which are a hazard to navigation shall be encoded if the depth of the underwater rock is otherwise not displayed.
- If the depth of the **Underwater/Awash Rock** is less than the minimum depth of the surrounding **Depth Area exposition of sounding** (EXPSOU) has to be encoded.

## 13.5 Wreck

**IHO Definition:** **WRECK.** The ruined remains of a stranded or sunken vessel which has been rendered useless. (IHO Dictionary – S-32).

<sup>†</sup> Exactly one of the attributes **category of wreck** or **value of sounding** must be populated.

; **category of wreck** is mandatory if the attribute **height** has been populated with a value.

Complex attribute **feature name**, sub-attribute **name usage** is mandatory if the name is intended to be displayed when display of names is enabled by the boatmaster. See clause 2.5.8.

For each instance of **information**, at least one of the sub-attributes **file reference** or **text** must be populated.

The Inland ECDIS or ECS "system" attribute **default clearance depth** must be populated with a value, which must not be an empty (null) value, if the attribute **height** has not been populated and the attribute **category of wreck** is populated or the attribute **value of sounding** is populated with an empty (null) value.

#### 13.5.1 Wrecks

Wrecks must be encoded to whatever depth they are considered to be of interest, also taking account of the needs of submarines and fishing vessels where appropriate. Population of the attributes **category of wreck**, **quality of vertical measurement**, **technique of vertical measurement** and **water level effect** are described in Table 13-3 below.

In the following Table, the symbol '/' indicates that this attribute is not relevant for the wreck instance and therefore must not be encoded. A blank indicates that the encoder may choose a relevant value for the attribute.

| Wrecks...                                                                      | category of wreck | water level effect | quality of vertical measurement | technique of vertical measurement |
|--------------------------------------------------------------------------------|-------------------|--------------------|---------------------------------|-----------------------------------|
| Showing any part of hull or superstructure (visible at high water)             | 5                 | 1 or 2             | /                               | /                                 |
| Showing any part of hull or superstructure (visible at low water)              | 5                 | 4                  |                                 |                                   |
| Covers and uncovers                                                            | 4 or 5            | 4                  |                                 |                                   |
| Awash                                                                          |                   | 5                  |                                 |                                   |
| Only the mast is visible at high water                                         | 4 or 5            | 1                  | /                               | /                                 |
| Only the mast is visible at low water                                          | 4                 | 4                  |                                 |                                   |
| Measured depth                                                                 |                   | 3                  | 1, 6 or<br><undefined>          |                                   |

Table 13-3 – Wrecks – Attribute encoding

All wrecks should be encoded using one of the above combinations of attributes.

\* For a wreck where the least depth is unknown, the attribute value 2 (depth or least depth unknown) for **quality of vertical measurement** does not apply to the depth of the seabed near the wreck.

The provision of more quantitative information for wrecks where possible is particularly important in terms of the portrayal of wrecks in Inland ECDIS or ECS, as the classification of wrecks as “dangerous” or “non-dangerous” is not taken into account in Inland ECDIS or ECS when symbolizing **Wreck** features outside **Unsurveyed Area**. This often results in wrecks located in **Depth Area** or **Dredged Area** being symbolized as an obstruction to navigation where they are actually non-dangerous. Where the depth of the wreck is unknown, compilers should consider determining an estimated safe clearance value and populating **quality of vertical measurement** = 7 (least depth unknown, safe clearance at value shown).

#### Remarks:

- Only one of the attributes **category of wreck** or **value of sounding** must be populated, not both.
- The attribute **height** is only relevant for wrecks having attribute **water level effect** = 1 (partly submerged at high water) or 2 (always dry). Where **height** is populated, the attribute **value of sounding** must not be populated.
- The minimum depth, if known, over any submerged wreck, must be encoded using the attribute **value of sounding**. Where **value of sounding** is populated with an empty (null) value, display of the wreck in Inland ECDIS or ECS as an underwater hazard, in accordance with the boatmaster’s selected safety depth, will be dependent on the value populated for the Inland ECDIS or ECS “system” attribute **default clearance depth** (see clauses 2.4.5.1, 30.1 and 8<sup>th</sup> bullet below).
- An instance of the information type **Spatial Quality** (see clause 24.5) may be associated to the wreck geometry, using the association **Spatial Association**, to indicate, where required, that the

horizontal position and/or the vertical uncertainty for the wreck is of different (higher or lower) accuracy than indicated by the underlying **Quality of Bathymetric Data** Meta feature (see clause 3.8). Where **Spatial Quality** is associated to the wreck and **height** (when **water level effect** = 1 (partly submerged at high water) or 2 (always dry)) or **value of sounding** is populated with an empty (null) value, the value for the complex attribute **vertical uncertainty (uncertainty fixed)** on the associated **Spatial Quality**, where required, must also be populated as empty (null). See also clause 3.8.1.3.

- For reported, not confirmed wrecks, the date of the report must be populated, where known, using the attribute **reported date**.
- The distributed remains of a wreck must be encoded, where required, as a **Wreck** feature with attribute **category of wreck** = 3 (distributed remains of wreck). Even though the wreck may be safe for surface vessels to navigate over the wreck, it must not be encoded as foul ground (see clause 13.7).
- When encoding a **Wreck** feature, this should include the population of the attributes **value of sounding** and **quality of vertical measurement** where the depth of a wreck is known, or the depth is unknown but an estimated safe clearance can be determined. Where the depth is known, or the depth is unknown but an estimated safe clearance has been determined, it is not required to populate the attribute **category of wreck** = 1 (non-dangerous wreck) or 2 (dangerous wreck), as the boatmaster has the quantitative information in order to determine whether the wreck may be dangerous to their type of vessel.
- If it is required to encode a submerged **Wreck** feature where the attribute **value of sounding** is populated with an empty (null) value, but the source information indicates the depth of the feature is within the range of the surrounding depth area, the value **exposition of sounding** = 1 (within the range of the surrounding depth area) must be populated in order to avoid the unnecessary display of isolated danger symbols in Inland ECDIS or ECS.
- For wrecks visible or partly visible at sounding datum, the height or drying height should be encoded, if known. This helps to distinguish wrecks which are always visible from wrecks which are only visible at low tide.

#### 13.5.1.1 Where a wreck is shown with its true shape (large scale IENCs)

Soundings and heights are often given inside a wreck to show the highest points of the hull or superstructure (for example mast, funnel). If it is required to encode such features, they must be done using:

- A **Wreck** feature of type surface with all populated attributes applying to the highest point of the wreck.
- **Land Elevation** features of type point to encode the features of the wreck that are always dry; the type of each feature (for example mast, funnel) may be encoded using the complex attribute **information** (see clause 2.4.6).
- **Sounding** features to encode the features of wrecks which are always submerged, or cover and uncover; the type of each feature (for example mast, funnel) may be encoded using the complex attribute **information** (see clause 2.4.6), which means that these soundings must be encoded individually.

#### 13.5.1.2 Changing criteria for wrecks

Historically the criteria used for differentiating between “dangerous” and “non-dangerous” wrecks were often based on a threshold value for the estimated depth over the wreck (for example 20 m, 28 m). Criteria have varied between nations and over time (due to the increasing draught of large vessels). The term “nondangerous wreck” may be applied even though a wreck may be dangerous to some vessels capable of navigating in the vicinity. Unfortunately, the boatmaster is not necessarily aware of that fact or that, due to the changing criteria, wrecks encoded as “non-dangerous” may have different meanings. Ideally, therefore, all encoded “dangerous” and “non-dangerous” wrecks having no known depth should be re-assessed.

### 13.5.2 Historic wrecks

Many nations have designated areas around certain wrecks of historical or cultural (for example sea graves) importance to protect the wrecks from unauthorised interference (for example by diving, salvage or anchoring). Such areas should be encoded on the largest optimum display scale IENC data covering the wreck.

If it is required to encode a restricted area around a historic wreck, it must be done using a **Restricted Area** feature (see clause 17.8), with attribute **category of restricted area** = 10 (historic wreck area).

In addition, the wreck itself should be encoded as a **Wreck** feature, with attribute **status** = 13 (historic).

Distinction: Depth Area; Hulk; Obstruction; Sounding; Underwater/Awash Rock.

#### Inland specific Encoding Instructions:

- A) Any wreck in navigable water in- or outside the channel known to exist and confirmed through reliable means, shall be encoded.
- B) **Wrecks** are removed only upon confirmation from reliable means that the **Wreck** does not exist at or near the charted position.
- C) The true or actual location is not needed for removal of the erroneous location.
- D) Use **value of sounding** (VALSOU) only in case **water level effect** (WATLEV) = 3 and indicate the depth of the top end of the **Wreck** referred to the same water level the surrounding depth information is also referred to.
- E) Where a **Wreck** (WRECKS) surface includes other **Wreck** (WRECKS) point features, the encoded values of the attributes **quality of vertical measurement** (QUASOU), **technique of vertical measurement** (TECSOU), **value of sounding** (VALSOU) and **water level effect** (WATLEV) for the surface feature have to be identical to the values for the shallowest point feature.

## 13.6 Obstruction

**IHO Definition: OBSTRUCTION.** In marine navigation, anything that hinders or prevents movement, particularly anything that endangers or prevents passage of a vessel. The term is usually used to refer to an isolated danger to navigation, such as a sunken rock or pinnacle. (IHO Dictionary – S-32). Examples of obstructions include: snags, stumps, wellheads, diffusers, cribs, fish havens, foul areas, foul grounds, booms, ice booms and ground tackle.

† Exactly one of the attributes **height** or **value of sounding** must be populated.

Complex attribute **feature name**, sub-attribute **name usage** is mandatory if the name is intended to be displayed when display of names is enabled by the boatmaster. See clause 2.5.8.

For each instance of **information**, at least one of the sub-attributes **file reference** or **text** must be populated.

The Inland ECDIS or ECS "system" attribute **default clearance depth** must be populated with a value, which must not be an empty (null) value, if the attribute **height** is not populated and the attribute **value of sounding** is populated with an empty (null) value.

### 13.6.1 Obstructions and foul areas

If it is required to encode features considered to be an obstruction or hazard to surface navigation that cannot be encoded using any other S-401 specific feature (for example **Underwater Rock**, **Wreck**), it must be done using the feature **Obstruction**.

Population of the attributes **quality of vertical measurement**, **technique of vertical measurement** and **water level effect** are described in Table 13-4 below.

In the following Table, the symbol '/' indicates that this attribute is not relevant for the obstruction instance and therefore must not be encoded. A blank indicates that the encoder may choose a relevant value for the attribute.

| Obstruction...                        | water level effect | quality of vertical measurement | technique of vertical measurement |
|---------------------------------------|--------------------|---------------------------------|-----------------------------------|
| Depth unknown                         | 3 or 4             | 2* or <undefined>               | /                                 |
| Least depth known                     | 3 or 4             | 1 or 6                          |                                   |
| Mechanically swept to the depth shown | 3                  | 6                               | 18                                |
| Measured by diver                     | 3                  | 1 or 6                          | 4                                 |

**Table 13-4 – Obstructions – Attribute encoding**

All obstructions should be encoded using one of the above combinations of attributes.

\* For an obstruction where the least depth is unknown, the attribute value 2 (depth or least depth unknown) for **quality of vertical measurement** does not apply to the depth of the seabed near the obstruction.

It is important when encoding obstructions to be aware of the distinction between attribute value **category of obstruction** = 6 (foul area) and foul ground:

Foul areas are defined as areas of numerous uncharted dangers to navigation. When encoded on IENC, **Obstruction** features of type surface with attribute **category of obstruction** = 6 (foul area) will display in the Inland ECDIS or ECS “base display” as an obstruction to navigation, with all associated alarms to indicate that it is unsafe for vessels to enter or transit the area.

Foul ground is defined as an area over which it is safe to navigate but which should be avoided for anchoring, taking the ground or ground fishing. When encoded on IENC, **Foul Ground** features (see clause 13.7) of type surface will display in the Inland ECDIS or ECS “other” display as a “foul area of seabed safe for navigation but not for anchoring”, indicating to the boatmaster that it is safe to enter or transit the area but hazardous to take the ground or undertake other subsurface activities.

In some cases areas on the source indicated to be foul ground have been misinterpreted as foul areas, which has resulted in encoding in IENC of **Obstruction** with **category of obstruction** = 6 (foul area). This encoding results in the incorrect indication in the Inland ECDIS or ECS that the area is unsafe for navigation, which is potentially confusing to the boatmaster.

Foul ground, over which it is safe to navigate but which should be avoided for anchoring, taking the ground or ground fishing, should be encoded using a **Foul Ground** feature (see clause 13.7). Although the source may depict a “Foul Area”, it should be determined whether it is in fact “Foul Ground” before encoding the appropriate feature.

#### Remarks:

- Only one of the attributes **height** or **value of sounding** must be populated, not both.
- The minimum depth, if known, over any submerged obstruction, must be encoded using the attribute **value of sounding**. Where **value of sounding** is populated with an empty (null) value, display of the obstruction in Inland ECDIS or ECS as an underwater hazard, in accordance with the boatmaster’s selected safety depth, will be dependent on the value populated for the Inland ECDIS or ECS “system” attribute **default clearance depth** (see clauses 2.4.5.1, 30.1 and 12<sup>th</sup> bullet below).
- Where obstructions such as fish havens have a declared maximum authorised draught for vessels passing over the feature, this must be populated, where known, using the attribute **maximum permitted draught**.
- The attribute **height** must be populated for **Obstruction** features having attribute **water level effect** = 1 (partly submerged at high water) or 2 (always dry).
- **Obstruction** features having attribute **water level effect** = 7 (floating) must have the attribute **height** populated with an empty (null) value.
- The attribute **vertical length** is used to populate the distance of an obstruction above the seabed; or the height of a floating obstruction above the waterway surface.
- An instance of the information type **Spatial Quality** (see clause 24.5) may be associated to the obstruction geometry, using the association **Spatial Association**, to indicate, where required, that the horizontal position and/or the vertical uncertainty for the obstruction is of different (higher or lower) accuracy than indicated by the underlying **Quality of Bathymetric Data** Meta feature (see clause 3.8). Where **Spatial Quality** is associated to the obstruction and **height** or **value of sounding** is populated with an empty (null) value, the value for the attribute **vertical uncertainty (uncertainty fixed)** on the associated **Spatial Quality**, where required, must also be populated as empty (null). See also clause 3.8.1.3 (Sounding uncertainty).
- For reported, not confirmed obstructions, the date of the report must be populated, where known, using the attribute **reported date**.

- If the nature of a dangerous underwater feature, dangerous underwater area, or floating feature is not explicitly known, it must be encoded using **Obstruction**.
- An **Obstruction** feature of type surface must be covered by a surface feature from Skin of the Earth as appropriate.
- An area containing numerous dangers, through which navigation is not safe at the optimum display scale for the IENC data, should be encoded using an **Obstruction** feature of type surface, with attribute **category of obstruction** = 6 (foul area).
- If it is required to encode a submerged **Obstruction** feature where the attribute **value of sounding** is populated with an empty (null) value, but the source information indicates the depth of the feature is within the range of the surrounding depth area, the value **exposition of sounding** = 1 (within the range of the surrounding depth area) must be populated in order to avoid the unnecessary display of isolated danger symbols in Inland ECDIS or ECS.
- Active submarine volcanos can be a significant navigational hazard; and harmful concentrations of volcanic gases emanating from active submarine volcanos can cover an extensive. If it is required to encode an active submarine volcano, it must be done using an **Obstruction** feature of type point, with attributes **category of obstruction** = 21 (active submarine volcano), **exposition of sounding** = 2 (shoaler than the range of depth of the surrounding depth area) and **quality of vertical measurement** = 2 (depth or least depth unknown). To indicate the unpredictable nature of the volcano (it may be periodically submerged or extend above the surface), the mandatory attributes **value of sounding** and **water level effect** must be populated with an empty (null) value. In order to raise the level of indication of the hazard in the Inland ECDIS or ECS to the boatmaster so as to generate an alarm, a small **Depth Area** feature having attribute **depth range minimum value** = 0 may also be encoded. The area that can be potentially covered by harmful volcanic gases, which may cover an area of up to 10 NM from the volcano, should be encoded using a **Caution Area** feature (see clause 16.11), having the complex attribute **information** (see clause 2.4.6), sub-attributes **text** = *Volcanic activity* and **file reference** carrying a reference to an appropriate cautionary note similar to:  
*Active submarine volcanos exist in this area. Some volcanos have been reported to erupt breaking the surface of the sea and projecting ashes, other volcanic materials and harmful gases into the air. Changes to charted depths, uplifting of reefs and emerging of volcanic islets may occur throughout the area. Due to the unpredictable nature of these events Mariners are strongly recommended to avoid the area.*  
 Inactive submarine volcanos must be encoded, if required, using a **Sea Area** feature (see clause 9.1).
- Platforms which have been cut-off above the seabed must be encoded as **Obstruction**, while platforms which have been cut-off to the level of the seabed should be encoded as **Foul Ground** (see clause 13.7).
- In certain circumstances where an obstruction is always dry (for example cribs), it must be covered by a **Land Area** feature.
- Features that are considered to be subsurface Fish Aggregating Devices (FAD) must be encoded as **Obstruction**, with **category of obstruction** = 5 (fish haven), unless the feature is a vessel that has been deliberately sunk to perform the function of a fish haven, which should be encoded as a **Wreck** feature (see clause 13.5).
- If it is required to encode a subsurface ocean data acquisition system (ODAS), whether on the seabed or suspended in the water column by a subsurface float, it must be done using **Obstruction** with **category of obstruction** = 14 (subsurface ocean data acquisition system (ODAS)). An ODAS buoy must be encoded as a **Special Purpose/General Buoy** feature (see clause 20.5).

#### 13.6.1.1 Mangroves

Where the source indicates that a mangrove area is in the intertidal area, an **Obstruction** feature of type area, with attribute **category of obstruction** = 23 (mangrove) should be encoded on top of the portion of the intertidal area (**Depth Area** with attributes **depth range minimum value** = -H and **depth range maximum value** = 0 – see clause 11.6.3) where the mangrove coverage exists. The mandatory attribute **water level effect** should be populated with 1 (partially submerged at high water); and the

conditional mandatory attribute **height** populated with the approximate altitude of the highest point of the top of the mangroves if known or an empty (null) value if not. The seaward spatial type(s) of the mangrove area should be associated to an instance of the information type **Spatial Quality** (see clause 24.5) having the attribute **quality of horizontal measurement** = 4 (approximate). The landward edge of the mangrove area representing the high water line should be encoded as **Coastline** (see clause 5.3), having no value populated for the attribute **category of coastline**, and no value for **quality of horizontal measurement** on the related spatial type(s).

If it is required to encode an individual mangrove tree within the intertidal area, this must be done using an **Obstruction** feature of type point, with attribute **category of obstruction** = 23 (mangrove).

Where mangrove areas are required to be generalised on smaller optimum display scale IENC datasets such that the seaward edge of the mangrove only is to be indicated as the “apparent” coastline, this must be done using the feature **Coastline** (see clause 5.3).

Remarks:

- The encoding of **Obstruction** of type curve and having attribute **category of obstruction** = 23 (mangrove) is prohibited.

Distinction: Depth Area; Fishing Facility; Foul Ground; Marine Farm/Culture; Underwater/awash Rock; Water Turbulence; Wreck.

Inland specific Encoding Instructions:

- A) Bank and shoal at a small scale are encoded as a point feature **Obstruction** (OBSTRN). Depth above the bank relative to the project water level is encoded by attribute **value of sounding** (VALSOU).
- B) Limits of obstruction are encoded as a spatial feature (edge). The obstruction itself is encoded as a point feature **Obstruction** (OBSTRN) with attribute **category of obstruction** (CATOBS) set to corresponding value.
- C) Group of rocks is encoded as a surface feature **Obstruction** (OBSTRN) with attribute **nature of surface** (NATSUR) = 9 (rocky).
- D) Underwater obstruction at a large scale is encoded as a surface feature **Obstruction** (OBSTRN) with attribute **category of obstruction** (CATOBS) set to corresponding value. Depth above the obstruction relative to the project water level is encoded by attribute **value of sounding** (VALSOU).
- E) Underwater obstruction at a small scale is encoded as a point feature **Obstruction** (OBSTRN) with attribute **category of obstruction** (CATOBS) set to corresponding value. Depth above the obstruction relative to the project water level is encoded by attribute **value of sounding** (VALSOU).
- F) Pile under-water is encoded as a point feature **Obstruction** (OBSTRN) with attribute **category of obstruction** (CATOBS) set to 1 (snag) and attribute **water level effect** (WATLEV) set to 3 (always under water).
- G) Crib obstruction above-water is encoded as a point feature **Obstruction** (OBSTRN) with attribute **category of obstruction** (CATOBS) set to 4 (crib) and attribute **water level effect** (WATLEV) set to 2 (always dry).
- H) Pile obstruction above-water is encoded as a point feature **Obstruction** (OBSTRN) with attribute **category of obstruction** (CATOBS) set to 1 (snag) and attribute **water level effect** (WATLEV) set to 2 (always dry).
- I) Crib obstruction under-water is encoded as a point feature **Obstruction** (OBSTRN) with attribute **category of obstruction** (CATOBS) set to 4 (crib) and attribute **water level effect** (WATLEV) set to 3 (always under water).

- J) Pile obstruction under-water is encoded as a point feature **Obstruction** (OBSTRN) with attribute **category of obstruction** (CATOBS) set to 1 (snag) and attribute **water level effect** (WATLEV) set to 3 (always under water).
- K) Snags, stumps, wellheads, diffusers, fish havens, foul areas, foul grounds, booms, ice booms and ground tackle should be encoded as **Obstruction** (OBSTRN), if they endanger or prevent the passage of vessels.
- L) Diffusers are encoded as **Obstruction** (OBSTRN) with **category of obstruction** (CATOBS) = 3 (diffuser).
- M) If the nature of a dangerous underwater object, dangerous underwater area, or floating object is not explicitly known, it must be encoded as an **Obstruction** (OBSTRN).
- N) Where an **Obstruction** (OBSTRN) surface includes other **Obstruction** (OBSTRN) point features, the encoded values of the attributes **value of sounding** (VALSOU) and **water level effect** (WATLEV) for the surface feature have to be identical to the values for the shallowest point feature.
- O) Fishing net obstruction above-water is encoded as a curve or surface feature **Obstruction** (OBSTRN) with attribute **category of obstruction** (CATOBS) set to 11 (fishing net) and attribute **water level effect** (WATLEV) set to 2 (always dry).

### 13.7 Foul ground

**IHO Definition:** **FOUL GROUND**. Areas over which it is safe to navigate but which should be avoided for anchoring, taking the ground or ground fishing. (IHO Dictionary – S-32).

**S-401 Geo Feature: Foul Ground (OBSTRN) (M)**

**Primitives: Point, Surface**

<sup>†</sup> Complex attribute **feature name**, sub-attribute **name usage** is mandatory if the name is intended to be displayed when display of names is enabled by the boatmaster. See clause 2.5.8.

For each instance of **information**, at least one of the sub-attributes **file reference** or **text** must be populated.

#### 13.7.1 Foul ground

If it is required to encode an area where seabed operations are unsafe, but over which it is safe to navigate for surface vessels, it must be done using the feature **Foul Ground**. Such areas are distinct from the feature **Obstruction**, attribute **category of obstruction** = 6 (foul area), where navigation is considered to be unsafe for surface vessels (see clause 13.6).

It is important when encoding foul ground to be aware of the distinction between foul ground and the feature **Obstruction**, attribute **category of obstruction** = 6 (foul area) :

Foul ground is defined as an area over which it is safe to navigate but which should be avoided for anchoring, taking the ground or ground fishing. When encoded on IENC, **Foul Ground** features of type surface will display in the Inland ECDIS or ECS “other” display as a “foul area of seabed safe for

navigation but not for anchoring”, indicating to the boatmaster that it is safe to enter or transit the area but hazardous to take the ground or undertake other subsurface activities.

Foul areas are defined as areas of numerous uncharted dangers to navigation. When encoded on IENC, **Obstruction** features of type surface with attribute **category of obstruction** = 6 (foul area) will display in the Inland ECDIS or ECS “base display” as an obstruction to navigation, with all associated alarms to indicate that it is unsafe for vessels to enter or transit the area.

It is recommended that if there is any doubt as to whether a feature should be encoded as **Obstruction** or **Foul Ground**, preference should be given to encoding the feature as **Obstruction** (see clause 13.6).

Remarks:

- For reported, not confirmed foul ground, the date of the report must be populated, where known, using the attribute **reported date**.
- A **Foul Ground** feature of type surface must be covered by a surface feature from Skin of the Earth as appropriate (**Depth Area**, **Dredged Area** or **Unsurveyed Area**).
- Platforms which have been cut-off to the level of the seabed should be encoded as **Foul Ground**, while platforms which have been cut-off above the seabed must be encoded as **Obstruction** (see clause 13.6).
- The distributed remains of wrecks must be encoded using the feature **Wreck** (see clause 13.5), and must not be encoded as **Foul Ground**.

Distinction: Depth Area; Fishing Facility; Marine Farm/Culture; Obstruction; Seabed Area; Underwater/Awash Rock; Water Turbulence; Wreck.

Inland specific Encoding Instructions:

## 13.8 Fishing facility

**IHO Definition: FISHING FACILITY.** A structure for fishing purposes which can be an obstruction to ships in general. The position of these structures may vary frequently over time. (S-57 Edition 3.1, Appendix A – Chapter 1, Page 1.70, November 2000, as amended).

### **S-401 Geo Feature: Fishing Facility (FSHFAC) (O)**

#### **Primitives: Point, Curve, Surface**

† Complex attribute **feature name**, sub-attribute **name usage** is mandatory if the name is intended to be displayed when display of names is enabled by the boatmaster. See clause 2.5.8.

For each instance of **information**, at least one of the sub-attributes **file reference** or **text** must be populated.

#### 13.8.1 Fishing facilities

Fishing facilities are usually sited in shallow water, but tunny nets are often located in deeper water. They can be very large and extend up to several miles offshore; and form an obstruction to navigation.

If it is required to encode a fishing facility it must be done using the feature **Fishing Facility**.

##### Remarks:

- The attribute **vertical length** is used to populate the distance of the facility above the seabed.
- Certain types of fishing facilities such as tunny nets in deep water may be an obstruction to navigation. If **Fishing Facility** features are considered to be an obstruction or hazard to navigation, they should also be encoded with an **Obstruction** feature (see clause 13.6). Although this is contrary to IENC encoding principles (that is, double encoding), this solution is recommended for portraying dangers to navigation of this nature in the Inland ECDIS or ECS.
- Floating fish aggregating devices (FAD) must be encoded, where required, as **Special Purpose/General Buoy** features (see clause 20.5). Subsurface FADs (fish havens) must be encoded, where required, as **Obstruction** features (see clause 13.6).

Distinction: Marine Farm/Culture; Obstruction.

Inland specific Encoding Instructions:

---

### 13.9 Marine farm/culture

**IHO Definition:** **MARINE FARM/CULTURE.** An assemblage of cages, nets, rafts and floats or posts where fish, including shellfish, are artificially cultivated. (IHO Dictionary – S-32).

#### **S-401 Geo Feature: Marine Farm/Culture (MARCUL) (C)**

##### **Primitives: Point, Curve, Surface**

† Exactly one of the attributes **height** or **value of sounding** must be populated.

Complex attribute **feature name**, sub-attribute **name usage** is mandatory if the name is intended to be displayed when display of names is enabled by the boatmaster. See clause 2.5.8.

For each instance of **fixed date range**, at least one of the sub-attributes **date end** or **date start** must be populated.

For each instance of **information**, at least one of the sub-attributes **file reference** or **text** must be populated.

### 13.9.1 Marine farms

Marine farms are collections of cages, nets, rafts and floats, or posts, where fish, including shellfish, are reared. They may obstruct navigation, and are likely to be marked by buoys and possibly lights. They are not always confined to inshore locations. Shellfish beds are found in shallow water. Depending on vessel draught and tidal range, it is usually possible to navigate over them, at high water, but they can be damaged by vessels anchoring or grounding on them.

If it is required to encode a marine farm, it must be done using the feature **Marine Farm/Culture**.

#### Remarks:

- When it is required to encode the minimum depth of the feature, the attributes **exposition of sounding** and **quality of vertical measurement** and the mandatory attribute **value of sounding** must be used. When a **Marine Farm/Culture** feature covers an area of the seafloor at the optimum display scale of the data, the value of the attribute **value of sounding** represents the minimum depth, if known, over any structure used to form or support the marine farm, or within the area of the marine farm itself. The mandatory attribute **water level effect** must be used to encode the water level of the shallowest section of the area, if partly or completely under water.
- For additional guidance regarding the encoding of vessel speed limits, see clause 17.4.
- The attribute **height** must be populated for **Marine Farm/Culture** features having attribute **water level effect** = 1 (partly submerged at high water) or 2 (always dry).
- The attribute **vertical length** is used to populate the distance of the marine farm above the seabed.
- Where required, ground tackle associated with marine farms must be encoded as **Obstruction** features (see clause 13.6).

### 13.9.2 Fish havens

If it is required to encode a fish haven, it must be done using an **Obstruction** feature (see clause 13.6), with attribute **category of obstruction** = 5 (fish haven).

Distinction: Fishing Facility; Obstruction.

#### Inland specific Encoding Instructions:

- If **value of sounding** (VALSOU) is provided **vertical uncertainty** (SOUACC) and **vertical datum** (VERDAT) should also be provided.
- Use **status** (STATUS) if any of the conditions apply.
- Marine Farms/Cultures in navigable waters shall be encoded.

## 14 Geo Features – Offshore Installations

### 14.1 Offshore platform

| <b>IHO Definition: OFFSHORE PLATFORM.</b> A permanent offshore structure, either fixed or floating.<br>(Adapted from IHO Dictionary – S-32). |                                                                                                                |                                                                                                                                                                                                                                                                                                                                                                      |      |               |

† The attribute **colour pattern** is mandatory for offshore platforms that have more than one value populated for the attribute **colour**.

Complex attribute **feature name**, sub-attribute **name usage** is mandatory if the name is intended to be displayed when display of names is enabled by the boatmaster. See clause 2.5.8.

For each instance of **fixed date range**, at least one of the sub-attributes **date end** or **date start** must be populated.

For each instance of **information**, at least one of the sub-attributes **file reference** or **text** must be populated.

#### 14.1.1 Offshore platforms

Several different types of platforms are in use. They are normally piled steel or concrete structures, the latter held in position on the seafloor by gravity. Tension Leg Platforms (TLP) consist of semi-submersible platforms secured to flooded caissons on the seafloor vertically below them by wires kept in tension by the buoyancy of the platform.

Platforms may serve a number of purposes. They may carry any of the following equipment: drilling and production equipment; oil and gas separation and treatment plants; pump-line stations; and electricity generators. They may be fitted with cranes, a helicopter landing deck, and accommodation for up to 350 people. Platforms may stand singly or in groups connected by pipelines. Some stand close together in a complex, with bridges and underwater cables connecting them. Unwanted gas or oil is sometimes burnt from a flaring boom extending from the platform or from a nearby flare stack.

If it is required to encode a permanent offshore platform, it must be done using the feature **Offshore Platform**.

##### Remarks:

- The attribute **height** is only relevant for fixed platforms, and is referred to the vertical datum (see clause 2.5.7).
- The attribute **vertical length** is only relevant for floating platforms, and is referred to the waterlevel.
- If it is required to encode sites of dismantled platforms, this must be done using **Foul Ground** features (see clause 13.7), unless the source indicates that any remaining structure protrudes far

enough above the seabed so as to be an obstruction to surface navigation, in which case this must be encoded using an **Obstruction** feature (see clause 13.6).

- Platforms may carry lights (see Section 19), fog signals (see clause 20.16), helicopter landing pads (see clause 6.5) and flare stacks. Where fitted, lights should be encoded as described in Section 19, with the **Offshore Platform** being used as the structure feature for the light equipment feature(s).

#### 14.1.2 Wellheads

In the course of developing an oil or gas field, numerous wells may be drilled. Some, which will not be required again, may be sealed at or below the seafloor and abandoned; such wells must not be encoded, as they have no relevance to navigation.

A submerged wellhead is a submarine structure projecting some distance above the seafloor and capping a temporarily abandoned (or “suspended”) oil or gas well. Their associated pipes and other equipment usually project some 2 - 6 metres, but in some cases as much as 15 metres, above the seafloor. Some may be covered by steel cages to avoid snagging trawling gear. In certain instances, a wellhead may project above the sea surface. Wellheads must be encoded on at least the largest optimum display scale ENC data, together with associated buoys, as a hazard to fishing and, dependent on depth, as a hazard to deep-draught vessels and towed structures.

If it is required to encode wellheads, this must be done using **Obstruction** features of type point (see clause 13.6), with attributes:

|                                |                                                                                                    |
|--------------------------------|----------------------------------------------------------------------------------------------------|
| <b>category of obstruction</b> | - 2 - wellhead                                                                                     |
| <b>height</b>                  |                                                                                                    |
| <b>status</b>                  | - 4 - not in use (disused)                                                                         |
| <b>value of sounding</b>       |                                                                                                    |
| <b>vertical length</b>         | - vertical length of the wellhead above the seabed                                                 |
| <b>water level effect</b>      | - 2 - always dry (for wellheads that protrude at high water)<br>- 3 - always under water/submerged |

#### 14.1.3 Offshore safety zones

Under UNCLOS, a coastal State may establish safety zones around artificial islands, installations and structures in their EEZ and on their continental shelf. These installations include drilling rigs, production platforms, wellheads, moorings and other associated structures. Safety zones normally extend 500 metres from the outermost points of the installations. Within these zones, appropriate measures can be taken to ensure the safety of navigation and of the installations.

If it is required to encode an offshore safety zone, it must be done using a **Restricted Area** feature (see clause 17.8), with attribute **category of restricted area** = 1 (offshore safety zone).

#### 14.1.4 Offshore flare stacks

As with refineries on land, offshore terminals may burn off gas from production platforms or from “flare stacks” set up as separate structures at a short distance from the production platforms.

If it is required to indicate the presence of a flare stack on an offshore platform, it must be done through population of the Boolean attribute **flare stack** = *True*.

#### Remarks:

- Flare stacks on land must be encoded, if required, using a **Landmark** feature (see clause 7.2).

Distinction: Hulk; Landmark; Installation Buoy; Offshore Production Area; Wind Turbine.

Inland specific Encoding Instructions:

- A) EUR: Offshore platforms shall be encoded.

## 14.2 Submarine cable

**IHO Definition:** **SUBMARINE CABLE.** An assembly of wires or fibres, or a wire rope or chain, which has been laid underwater or buried beneath the seafloor. (IHO Dictionary – S-32).

### **S-401 Geo Feature: Cable Submarine (CBLSUB) (C)**

#### **Primitives: Curve**

† Complex attribute **feature name**, sub-attribute **name usage** is mandatory if the name is intended to be displayed when display of names is enabled by the boatmaster. See clause 2.5.8.

For each instance of **fixed date range**, at least one of the sub-attributes **date end** or **date start** must be populated.

For each instance of **information**, at least one of the sub-attributes **file reference** or **text** must be populated.

#### 14.2.1 Submarine cables

Submarine cables are used to carry power or telecommunications. All power cables and most telecommunication cables carry dangerous voltages. Submarine cables are potential hazards to both vessels and life, particularly to fishing vessels engaged in trawling the seabed. Where possible, submarine cables are now buried beneath the seafloor in water depths of less than 1000 metres; however there remains a large percentage unburied. Submarine cables are vulnerable to damage from anchoring, trawling or other seabed operations; even small craft anchors can penetrate a soft seabed sufficiently to foul a cable. Damage to telecommunication cables can lead to extensive disruption of national and international communications, whilst damage to power cables can disrupt electricity supply.

Submarine cables, including disused cables, should be encoded to indicate their presence to vessels engaged in anchoring, trawling or seabed activities in order to:

- Warn boatmasters of the potential hazard to their vessel, including electric shock to any vessel fouling or breaking the cable, possible capsizing of a small vessel if its fishing gear or anchor is trapped under the cable, or loss of gear (trawls or anchor cables).
- Prevent damage to the cable and avoid disrupting the service the cable may be providing.

Active cables should be encoded to a depth of 2000 metres (which is the deepest depth of water to which vessels may be endangered by fouling the cable).

If it is required to encode a submarine cable, it must be done using the feature **Cable Submarine**.

Remarks:

- If the buried depth varies along the cable, the cable must be encoded as several features.
- Telecommunications cables such as telephone and optic fibre cable must be populated, where required, by populating attribute **category of cable** = 10 (telecommunications cable).
- Where a cable is disused, it should be encoded with the attribute **status** = 4 (not in use), and the attribute **category of cable** should not be encoded. Few disused cables are recovered and so to encode them all would lead to clutter in the data. Also, accurate records of their positions are likely to be incomplete (some cables having been cut or dragged out of position), so there is a case for encoding them very selectively. Where disused cables traverse possible anchorages or where there is known seabed activity, for example trawling grounds, they should be encoded on the largest optimum display scale IENC data covering the area, provided they do not obscure more important information.
- If it is required to provide the contact details of cable owners/operators (in cases of damage to a cable or for reparation for loss of an anchor in order to avoid such damage), this must be done using an associated instance of the information type **Contact Details** (see clause 24.1).
- Cables, buried so deep that they are not vulnerable to damage from anchoring, should not be encoded (so that boatmasters are not unnecessarily inhibited from anchoring or fishing). In marginal cases they may be encoded as **Cable Submarine** with the nominal depth to which they are buried encoded using the attribute **buried depth**.
- For encoding cables for mooring trots, see clause 8.23.
- Distinction: Cable Overhead; Cable Area.

Inland specific Encoding Instructions:

- A) Only cables or cable areas where anchoring is prohibited need to be encoded.
- B) **Cable Submarine** features should be encoded just inside the shoreline to minimize clutter.
- C) If there are multiple cables in the same area, do not code as **Cable Submarine** (CBLSUB), but as a **Submarine Cable Area** (CBLARE) (see 14.3)
- D) EUR: If there is an anchoring prohibited notice mark this should be encoded by an anchoring prohibited **Notice Mark** (notmrk) feature (see 20.17).
- E) EUR: If there is a notice mark indicating the presence of a submarine cable this may be encoded by an anchoring prohibited **Notice Mark** (notmrk) feature (see 20.17). If such a notice mark is positioned in the waterway, it must be encoded.
- F) US: Create **Caution Area** (CTNARE) feature buffering the cable 20 metres upstream and downstream of the cable with **information text** (INFORM) cable buffer zone.
- G) Use **status** (STATUS) = 18 (existence doubtful) in the case where the existence of the feature cannot be confirmed.
- H) **feature name** (OBJNAM) should be used for the name of the owner.

### 14.3 Submarine cable area

**IHO Definition:** **SUBMARINE CABLE AREA.** An area which contains one or more submarine cables. (S-57 Edition 3.1, Appendix A – Chapter 1, Page 1.70, November 2000, as amended).

#### **S-401 Geo Feature: Cable Area (CBLARE) I**

| -                     | <b>Spatial Association</b> (see clause 25.10)   | <b>Spatial Quality</b>                       | Association | 0,*          |

† Complex attribute **feature name**, sub-attribute **name usage** is mandatory if the name is intended to be displayed when display of names is enabled by the boatmaster. See clause 2.5.8.

For each instance of **fixed date range**, at least one of the sub-attributes **date end** or **date start** must be populated.

For each instance of **information**, at least one of the sub-attributes **file reference** or **text** must be populated.

#### 14.3.1 Submarine cable areas

Cable areas should be encoded where:

- cables (including disused cables) are so numerous in an area that it would be impossible to encode them individually without impairing the legibility of the IENC; or
- a regulatory authority designates an area for the protection of a cable, or cables.

If it is required to encode a submarine cable area, it must be done using the feature **Cable Area**.

Remarks:

- Where populated, the attribute **status** must only be used to encode the status of the area and not the status of the cables in the area.
- For additional guidance regarding the encoding of vessel speed limits, see clause 17.4.
- The outer limits of a cable area must enclose the area in which anchoring and certain forms of fishing are prohibited or inadvisable; that is, the limits must lie a safe distance beyond the actual lines of the outermost cables.
- If it is required to provide the contact details of cable owners/operators (in cases of damage to a cable or for reparation for loss of an anchor in order to avoid such damage), this must be done using an associated instance of the information type **Contact Details** (see clause 24.1).

Distinction: Cable Overhead; Cable Submarine.

Inland specific Encoding Instructions:

- A) Only cables or cable areas where anchoring is prohibited need to be encoded.
- B) **Cable Area** (CBLARE) should generally be used if;  $dFCLC/NC < 50$ , where dFCLC is distance between first cable and last cable in designated area, and NC is the number of cables; cartographic judgment should still be applied for final analysis.  
**Cable Areas** should be used, unless very precise single cable data is available. Symbology should never be used due to the unreliability of the cable location.
- C) Do not use both **Cable Submarine** and **Cable Area** to represent the same feature.
- D) If various types of cables exist in the area, include description in **file reference** (TXTDSC). If at least one of the cables is a powerline, **category of cable** (CATCBL) = 1 has to be used.
- E) US: Extend **Cable Area** (CBLARE) 20 metres beyond first and last cable; farther if uncertainty is greater.
- F) EUR: In case there is an anchoring prohibited notice mark this should be encoded by an anchoring prohibited **Notice Mark** (notmrk) feature (see 20.17).
- G) EUR: In case there is a notice mark indicating the presence of a submarine cable, this may be encoded by an anchoring prohibited **Notice Mark** (notmrk) feature (see 20.17). If such a notice mark is positioned in the waterway it must be encoded.
- H) Use **status** (STATUS) = 18 (existence doubtful) in the case where the existence of the feature cannot be confirmed.
- I) EUR: If the authority has extended the application of the prohibition of anchoring to the use of telescopic piles (spuds), restrn = 38 (use of spuds prohibited) must be encoded.
- J) For the cable between a ferry and the fixed point (e.g. anchor, mast) use a **Cable Area** (CBLARE) (not a **Cable Submarine** (CBLSUB) or **Cable Overhead** (cblohd)), as the position of the cable changes during the ride.
- K) **feature name** (OBJNAM) should be used for the name of the owner.

## 14.4 Pipeline

**IHO Definition: PIPELINE.** A connected set of pipes for conveying liquids, slurries, or gases. (Defence Geospatial Information Working Group; Feature Data Dictionary Register, 2012).

### **S-401 Geo Feature: Pipeline Submarine/On Land (PIPSOL) (C)**

† Complex attribute **feature name**, sub-attribute **name usage** is mandatory if the name is intended to be displayed when display of names is enabled by the boatmaster. See clause 2.5.8.

For each instance of **fixed date range**, at least one of the sub-attributes **date end** or **date start** must be populated.

For each instance of **information**, at least one of the sub-attributes **file reference** or **text** must be populated.

#### 14.4.1 Pipelines, submarine or on land

Submarine pipelines can be divided into two main categories:

- Oil, chemical, gas and water supply pipelines are an important feature of many areas. The pipes are generally encased in concrete for protection and to give them negative buoyancy, which can significantly increase their external diameter. Pipelines are generally laid directly on the seabed, with sections over local dips or hollows being supported physically from beneath. In some cases (for example in shallow water or near the shore), where the external diameter of the pipeline would represent a significant reduction in the water depth above it, the pipelines may be laid in trenches and possibly buried.
- In all cases it must be assumed that the pipes are vulnerable to damage from anchoring or trawling, although in a few cases concrete domes are used to protect particularly vulnerable junctions. Gas pipes present a severe hazard to ships damaging them (by fire, explosion, or possibly loss of buoyancy). Oil and chemical pipes are a danger to the environment if fractured. Damage to water pipes supplying residential areas, mainly islands, results in disruption or contamination of the water supply. In the above cases, submarine pipelines must be encoded on all appropriate optimum display scale IENC datasets.
- Outfalls and intakes such as sewers, and cooling water intakes, are mainly a feature of inshore waters. For small craft, in particular, such pipes are a potential danger to navigation. The pipes are also vulnerable to damage. They should be encoded on at least the largest optimum display scale IENC datasets.

If it is required to encode a submarine or land pipeline, it must be done using the feature **Pipeline Submarine/On Land**.

##### Remarks:

- A pipeline that extends vertically from the seabed must be encoded, if required, as an **Obstruction** feature (see clause 13.6). A vertical pipeline on land must be encoded, if required, as a **Landmark** feature (see clause 7.2).
- If the buried depth varies along a submerged pipeline, the pipeline must be encoded as several features.
- The attributes **depth range minimum value** and **depth range maximum value** are used to encode the shallowest and deepest depth over the pipeline.
- Where a bubble curtain pipeline is intended for the retention of oil, this must be encoded as an **Oil Barrier** feature (see clause 16.17), with attribute **category of oil barrier** = 1 (oil retention – high pressure pipe).

- Where a pipeline is disused, it should be encoded with the attribute **status** = 4 (not in use), and the attributes **category of pipeline/pipe** and **product** should not be encoded.
- The term “sub-surface pipeline” is used to describe a pipeline that is “floating” in the water column. If it is required to encode a sub-surface pipeline, this should be done using a **Pipeline Submarine/On Land** feature, with the attribute **depth range minimum value** populated with the minimum design depth over the pipeline. The attribute **depth range maximum value** may be populated with the maximum design depth over the pipeline. A picture file may be referenced using the attribute **pictorial representation** (see clause 2.4.12.2) if it is considered useful, for example a schematic diagram showing the clearances along the pipeline.
- If it is required to provide the contact details of submerged pipeline owners/operators (in cases of damage to a pipeline or for reparation for loss of an anchor in order to avoid such damage), this must be done using an associated instance of the information type **Contact Details** (see clause 24.1).
- Submarine pipes, buried so deep that they are not vulnerable to damage from anchoring, should not be encoded (so that boatmasters are not unnecessarily inhibited from anchoring or fishing). In marginal cases they may be encoded as **Pipeline Submarine/On Land** with the nominal depth to which they are buried encoded using the attribute **buried depth**.
- Buried pipelines on land should not be encoded.

#### 14.4.2 Diffusers, cribs

If it is required to encode diffusers and cribs, this must be done using **Obstruction** features (see clause 13.6), with attribute **category of obstruction** = 3 (diffuser) or 4 (crib).

Distinction: Pipeline Overhead, Submarine Pipeline Area.

#### Inland specific Encoding Instructions:

- Pipeline Submarine/On Land** features should be collected just inside the shoreline to minimize clutter.
- Only pipelines or pipeline areas where anchoring is prohibited need to be encoded.
- See **Submarine Pipeline Area** (PIPARE) for multiple pipelines.
- EUR: In case there is an anchoring prohibited notice mark this should be encoded by an anchoring prohibited **Notice Mark** (notmrk) feature (see 20.17).
- EUR: In case there is a notice mark indicating the presence of a submarine pipeline this may be encoded by an anchoring prohibited **Notice Mark** (notmrk) feature (see 20.17). If such a notice mark is positioned in the waterway it must be encoded.
- US: Create **Caution Area** (CTNARE) feature buffering the pipeline 20 metres upstream and downstream of the pipeline with **information text** (INFORM) cable buffer zone.
- US: For water intakes, place point **Pipeline Submarine/On Land** (PIPSOL) feature near intake location if actual pipe (line) location is unknown. Place 20 metre diameter **Caution Area** (CTNARE) around **Pipeline Submarine/On Land** (PIPSOL) (P).
- Use **status** (STATUS) = 18 (existence doubtful) in the case where the existence of the feature cannot be confirmed.
- feature name** (OBJNAM) should be used for the name of the owner.

## 14.5 Submarine pipeline area

**IHO Definition:** **SUBMARINE PIPELINE AREA.** An area containing one or more submarine pipelines. (Adapted from S-57 Edition 3.1, Appendix A – Chapter 1, Page 1.118, November 2000).

### **S-401 Geo Feature: Submarine Pipeline Area (PIPARE) (C)**

**Primitives:** Point, Surface

† Complex attribute **feature name**, sub-attribute **name usage** is mandatory if the name is intended to be displayed when display of names is enabled by the boatmaster. See clause 2.5.8.

For each instance of **fixed date range**, at least one of the sub-attributes **date end** or **date start** must be populated.

For each instance of **information**, at least one of the sub-attributes **file reference** or **text** must be populated.

### 14.5.1 Submarine pipeline areas

Submarine pipeline areas should be encoded where:

- pipelines (including disused pipelines) are so numerous in an area that it would be impossible to encode them individually without impairing the legibility of the IENC; or
- a regulatory authority designates an area for the protection of a pipeline, or pipelines.

If it is required to encode a submarine pipeline area, it must be done using the feature **Submarine Pipeline Area**.

#### Remarks:

- Where populated, the attribute **status** must only be used to encode the status of the area and not the status of the pipelines in the area.
- The outer limits of a pipeline area must correspond to the area in which anchoring, trawling and dredging are prohibited or inadvisable; that is, the limits must lie at a safe distance beyond the actual lines of the outermost pipes.
- Where a pipeline area is disused, the **Submarine Pipeline Area** should be encoded with the attribute **status** = 4 (not in use), and the attributes **category of pipeline/pipe** and **product** should not be encoded.
- For additional guidance regarding the encoding of vessel speed limits, see clause 17.4.
- If it is required to provide the contact details of submerged pipeline owners/operators (in cases of damage to a pipeline or for reparation for loss of an anchor in order to avoid such damage), this must be done using an associated instance of the information type **Contact Details** (see clause 24.1).

Distinction: Pipeline Overhead; Pipeline Submarine/On Land.

#### Inland specific Encoding Instructions:

- A) Only pipelines or pipeline areas where anchoring is prohibited need to be encoded.
- B) **Submarine Pipeline Area** (PIPARE) generally should be used if;  $dFPLP/NP < 50$ , where dFPLP is distance between first pipe and last pipe in designated area, and NP is the number of pipes; cartographic judgment still should be applied for final analysis.
- C) Extend **Submarine Pipeline Area** (PIPARE) 20 metres beyond first and last pipe; farther if uncertainty is greater.
- D) Use multiple values for **category of pipeline/pipe** (CATPIP) if various types are in the **Submarine Pipeline Area** (PIPARE).
- E) EUR: In case there is an anchoring prohibited notice mark this should be encoded by an anchoring prohibited **Notice Mark** (notmrk) feature (see 20.17).
- F) EUR: In case there is a notice mark indicating the presence of a submarine pipeline this may be encoded by an anchoring prohibited **Notice Mark** (notmrk) feature (see 20.17). If such a notice mark is positioned in the waterway it must be encoded.
- G) Use **status** (STATUS) = 18 (existence doubtful) in the case where the existence of the feature cannot be confirmed.
- H) EUR: If the authority has extended the application of the prohibition of anchoring to the use of telescopic piles (spuds), **restriction** (RESTRN) = 38 (use of spuds prohibited) must be encoded.
- I) **feature name** (OBJNAM) should be used for the name of the owner.

## 14.6 Offshore production area

IHO Definition: **OFFSHORE PRODUCTION AREA**. An area at sea within which there are production facilities. (S-57 Edition 3.1, Appendix A – Chapter 1, Page 1.113, November 2000).

### **S-401 Geo Feature: Offshore Production Area (OSPARE) (C)**

| <p>† Complex attribute <b>feature name</b>, sub-attribute <b>name usage</b> is mandatory if the name is intended to be displayed when display of names is enabled by the boatmaster. See clause 2.5.8.</p> <p>For each instance of <b>fixed date range</b>, at least one of the sub-attributes <b>date end</b> or <b>date start</b> must be populated.</p> <p>For each instance of <b>information</b>, at least one of the sub-attributes <b>file reference</b> or <b>text</b> must be populated.</p> <p><b>14.6.1 Offshore production areas</b></p> <p>Oil and gas fields are exploited in many parts of the world. Although the basic methods for extracting oil and gas are well established, details of the systems and structures may vary with the characteristics of the different fields and are continually being developed. In a typical field, oil or gas is obtained from wells drilled from fixed production platforms, usually standing on the seabed. From each production platform, the oil or gas is carried in pipes to a facilities platform where primary processing, compression and pumping are carried out. The oil or gas is then transported through pipelines to a nearby storage tank, tanker loading buoy or floating terminal, or direct to a tank farm on shore. One facilities platform may collect the oil or gas from several production platforms, and may supply a number of tanker loading buoys or storage units. Such facilities platforms are sometimes termed Field Terminal Platforms. Converted tankers or purpose-built vessels are often permanently moored and used as facilities platforms, floating terminals, and for storage.</p> <p>Other offshore energy production facilities include wind turbines and underwater current turbines. Other methods of harnessing tidal wave and solar energy are also in use.</p> <p>If it is required to encode an offshore production area, it must be done using the feature <b>Offshore Production Area</b>.</p> <p><u>Remarks:</u></p> <ul style="list-style-type: none"> <li>For additional guidance regarding the encoding of vessel speed limits, see clause 17.4.</li> <li>General information about a wind farm such as blade diameter and blade vertical clearance should be encoded, if required, using the complex attribute <b>information</b> (see clause 2.4.6). If it is required to encode individual offshore wind turbines, it should be done using a <b>Wind Turbine</b> feature (see clause 7.4).</li> <li>If it is required to encode individual wave energy devices or underwater turbines within a wave or current farm (or turbine field), it should be done using an <b>Obstruction</b> feature (see clause 13.6) or, if there are associated surface structures, using appropriate features, for example <b>Offshore Platform</b> or <b>Special Purpose/General Beacon</b> (see clauses 14.1 and 20.5). The extent and nature of any restricted area related to the feature should be encoded using a <b>Restricted Area</b> feature (see clause 17.8).</li> <li>If it is required to encode an offshore development area, it should be done using an <b>Offshore Production Area</b> feature, with attributes <b>category of offshore production area</b> and <b>product</b></li> </ul> |                                                 |                                              |             |                     |

populated with the appropriate value; and **condition** = 1 (under construction). A note describing the activities taking place within the area may be included using the complex attribute **information** (see clause 2.4.6). At the conclusion of the development of the area, the attribute **condition** and any associated note can then be removed from the feature.

#### 14.6.2 Offshore tanker loading systems

Although the oil and gas from some fields are sent ashore by submarine pipeline, a variety of mooring systems have been developed for use in deep water and in the vicinity of certain ports, to allow the loading of large vessels and the permanent mooring of floating storage vessels or units. These offshore systems include large mooring buoys, designed for mooring vessels up to 500,000 tonnes, and platforms on structures fixed at their lower ends to the seafloor. They allow a vessel to moor forward or aft to them, and to swing to the wind or stream. Those which are fixed are termed Single Point Moorings (SPM). Those which are a form of mooring buoy are termed Single Buoy Moorings (SBM). Like production platforms, SPM and SBM normally have lights and fog signals.

If it is required to encode an offshore tanker loading system, it must be done using the feature **Installation Buoy** (see clause 20.7).

If it is required to encode an articulated tower, it must be done using an **Offshore Platform** feature (see clause 14.1), with attribute:

**category of offshore platform** -4 - articulated loading platform

5 - single anchor leg mooring

8 - floating production, storage and off-loading vessel

10 - navigation, communication and control buoy (which may include storage facilities)

Distinction: Offshore Platform; Wind Turbine.

#### Inland specific Encoding Instructions:

- A) The vertical distance from the waterlevel to the highest point of the offshore platform should be encoded in **vertical length** (VERLEN).  
**Vertical length** (VERLEN) does not require a datum.
- B) EUR: The encoding of **Offshore Production Areas** is mandatory.

## 15 Geo Features – Tracks and Routes

### 15.1 Leading, clearing and transit lines and recommended tracks

If it is required to encode leading, clearing and transit lines and recommended tracks, it must be done using the features **Navigation Line** and **Recommended Track** (see clauses 15.3 and 15.4), and related point navigational aids features (see Section 20). This applies for visual and radio navigational aids.

NB. In North America the word “range” is used instead of “transit” and “leading line”.

### 15.2 Traffic separation schemes and traffic separation scheme systems

A traffic separation scheme is a routeing measure aimed at the separation of opposing streams of traffic by appropriate means and by the establishment of traffic lanes (IMO Ships’ Routeing). A traffic separation scheme separates opposing streams of marine traffic by the establishment of separation zones or lines and traffic lanes. It may include inshore traffic zones. A separation zone or line separates:

- 1) The traffic lanes in which ships are proceeding in opposite or nearly opposite directions,
- 2) A traffic lane from the adjacent sea area, or
- 3) Traffic lanes designated for particular classes of ships proceeding in the same direction.

If it is required to encode a traffic separation scheme, it must be done using:

- **Inshore Traffic Zone** (see clause 15.11);
- **Precautionary Area** (see clause 15.12);
- **Separation Zone or Line, Traffic Separation Scheme Boundary, Traffic Separation Scheme Crossing and Traffic Separation Scheme** (see clauses 15.14 to 15.17); and
- Navigational aids features (see Sections 18 to 21).

For guidance on provision of advance notification of changes to traffic separation schemes, see clause 31.1.1.

To encode a traffic separation scheme (TSS) system, the **Inshore Traffic Zone, Precautionary Area, Separation Zone or Line, Traffic Separation Scheme Boundary, Traffic Separation Scheme Crossing**, features must be associated with the **Traffic Separation Scheme** (see clause 15.17) using the association **Traffic Separation Scheme Aggregation** (see clause 25.14). The **Traffic Separation Scheme** may additionally be associated to the aids to navigation marking the components of the Scheme (if they are stated in the regulation defining the TSS) using the association **Aids to Navigation Association** (see clause 25.2). Where it is required to indicate the name of the complete TSS, this must be done using the attribute feature name for the **Traffic Separation Scheme**. Where it is required to populate textual information for the TSS, this should be done using the complex attribute **information** (see clause 2.4.6) for the **Traffic Separation Scheme**.

#### Remarks:

- Traffic separation scheme systems may be included with other routeing measures such as two-way routes, or another traffic separation scheme system, to comprise a complete traffic routeing system. To encode the relationship between routeing measures, the named association defining each routeing measure within the system (or the relevant feature if the routeing measure consists of a single feature) may be associated using a **Traffic Separation Scheme Aggregation** to form a hierarchical relationship (see clause 25.14). The individual elements comprising different routeing measures must not be aggregated into a single named association.

- All features comprising a TSS or TSS system must have the same value populated for the attribute **scale minimum** (see clause 2.5.9).

### 15.3 Navigation line

**IHO Definition: NAVIGATION LINE.** A straight line extending towards an area of navigational interest and generally generated by two navigational aids or one navigational aid and a bearing. (Service Hydrographique et Oceanographique de la Marine, France).

For IENCs a navigation line either defines a recommended track or marks the boundary between a safe and a dangerous area.

#### **S-401 Geo Feature: Navigation Line (NAVLNE) (O)**

##### **Primitives: Curve**

### Feature Associations

| S-401 Role         | Association Type                                | Associated to               | Type        | Multiplicity |
|--------------------|-------------------------------------------------|-----------------------------|-------------|--------------|
| The Updated Object | <b>Updated Information</b> (see clause 25.16)   | <b>Update Information</b>   | Association | 0,*          |
| -                  | <b>Additional Information</b> (see clause 25.1) | <b>Nautical Information</b> | Association | 0,*          |
| -                  | <b>Spatial Association</b> (see clause 25.10)   | <b>Spatial Quality</b>      | Association | 0,*          |

† For each instance of **fixed date range**, at least one of the sub-attributes **date end** or **date start** must be populated.

For each instance of **information**, at least one of the sub-attributes **file reference** or **text** must be populated.

Complex attribute **feature name**, sub-attribute **name usage** is mandatory if the name is intended to be displayed when display of names is enabled by the boatmaster. See clause 2.5.8.

### 15.3.1 Navigation lines

Clearing Lines are important in rocky areas where dangers are not guarded by buoys and where sailing vessels (which are not always able to keep to a direct track) and other small craft may navigate close inshore. Transits marking isolated dangers are based on beacons or other marks which are erected on shore to indicate (approximately, unless there are two pairs of beacons) the position of an isolated danger. Leading lines based on beacons or lights must be encoded where the optimum display scale for the IENC data permits. Leading lines based on natural features should be encoded on the largest optimum display scale IENC data where they appear to be useful, particularly if other navigational aids seem inadequate.

If it is required to encode a navigation line, it must be done using the feature **Navigation Line**.

The use of **Navigation Line** and **Recommended Track** (see clause 15.4) is defined in more detail in the following Table, and in Figure 15-4 below:

| Figure |                                     | Navigation Line                        | Recommended Track                  | Navigational Aids |
|--------|-------------------------------------|----------------------------------------|------------------------------------|-------------------|
| 1      | Recommended track on a leading line | <b>category of navigation line = 3</b> | <b>based on fixed marks = True</b> | at least 2        |
| 2      | Clearing line on marks in line      | <b>category of navigation line = 1</b> | none                               | at least 2        |
| 3      | Transit line on marks in line       | <b>category of navigation line = 2</b> | none                               | at least 2        |
| 4      | Recommended track on a bearing      | <b>category of navigation line = 3</b> | <b>based on fixed marks = True</b> | 1                 |

|   |                                            |                                 |                              |      |
|---|--------------------------------------------|---------------------------------|------------------------------|------|
| 5 | Clearing line on a bearing                 | category of navigation line = 1 | none                         | 1    |
| 6 | Transit line on a bearing                  | category of navigation line = 2 | none                         | 1    |
| 7 | Recommended track not based on fixed marks | none                            | based on fixed marks = False | none |

Table 15-1 – Navigation lines – Attribute encoding

Figure 15-4 – Navigation lines – Geometry encoding

Remarks:

- The value populated for the mandatory attribute **orientation value** must be the value of the bearing from seaward.
- The extent of the navigation line depends on the visibility of the navigational aids.
- The recommended track is that portion of a navigation line that a ship should use for navigation.

**15.3.2 Measured distances**

If the track to be followed is on a leading line or a bearing, it must be encoded in the way described in the Table and Figure 15-4 above (cases 1 or 4). If the track is not on a leading line or bearing, it must be encoded only as a **Navigation Line** feature with the attribute **category of navigation line** being set to an empty (null) value. In either case, if it is required to encode the measured distance, it must be done using the attribute **measured distance**.

If it is required to encode the transit lines, they must be done using **Navigation Line** features, with **category of navigation line** = 2 (transit line).

If it is required to encode the beacons, they must be done using **Special Purpose/General Beacon** features, with attribute **category of special purpose mark** = 17 (measured distance mark).

On occasions, one or more of the transits used for the measured distance may incorporate an existing landmark as the front or rear mark. In this case, if **Landmark** is encoded, **category of special purpose mark** = 17 must also be populated.

**Remarks:**

- All features comprising a measured distance must have the same value populated for the attribute **scale minimum** (see clause 2.5.9).

**Distinction:** Recommended Route Centreline; Recommended Track.

**Inland specific Encoding Instructions:**

- A) A **Navigation Line** is usually defined by two (leading) lights or beacons or a directional light.

## 15.4 Recommended track

IHO Definition: **RECOMMENDED TRACK**. A route which has been specially examined to ensure so far as possible that it is free of dangers and along which ships are advised to navigate. (IMO Ships' Routing).

For IENCs it is a recommended sailing route for all or certain vessels.

† Complex attribute **feature name**, sub-attribute **name usage** is mandatory if the name is intended to be displayed when display of names is enabled by the boatmaster. See clause 2.5.8.

For each instance of **fixed date range**, at least one of the sub-attributes **date end** or **date start** must be populated.

For each instance of **information**, at least one of the sub-attributes **file reference** or **text** must be populated.

#### 15.4.1 Recommended tracks

Recommended tracks usually comprise a number of sections (sometimes termed “legs”) which lead between dangers lying close on both sides of the track or fairway. Tracks commonly include some sections which are leading lines (see clause 15.1). The distinction between tracks and fairways, in this context, is that tracks have no specified outer limits and fairways do have specified outer limits.

It is important to recognise that it is not the role of cartographers to create “recommended” tracks and other

“recommended” routeing measures; such recommendations are made by other authorities. The word “Recommended”, used in connection with recommended tracks and other recommended routeing measures usually implies that it has been recommended by a competent authority. Occasionally, the recommendation may be based on advice directly from a competent surveyor or established by precedent.

Recommended tracks include all channels recommended for hydrographic reasons to lead safely between shoal depths. The use of such tracks is generally left to the discretion of the boatmaster and will depend on the vessel’s draught, the state of the tide, adequacy of navigational aids and so on.

If it is required to encode a recommended track, it must be done using the feature **Recommended Track**.

The use of **Navigation Line** and **Recommended Track** is defined in more detail in the following Table, and in Figure 15-5 below.

| Figure |                                            | Navigation Line                 | Recommended Track            | Navigational Aids |
|--------|--------------------------------------------|---------------------------------|------------------------------|-------------------|
| 1      | Recommended track on a leading line        | category of navigation line = 3 | based on fixed marks = True  | at least 2        |
| 2      | Clearing line on marks in line             | category of navigation line = 1 | none                         | at least 2        |
| 3      | Transit line on marks in line              | category of navigation line = 2 | none                         | at least 2        |
| 4      | Recommended track on a bearing             | category of navigation line = 3 | based on fixed marks = True  | 1                 |
| 5      | Clearing line on a bearing                 | category of navigation line = 1 | none                         | 1                 |
| 6      | Transit line on a bearing                  | category of navigation line = 2 | none                         | 1                 |
| 7      | Recommended track not based on fixed marks | none                            | based on fixed marks = False | none              |

**Table 15-5 – Navigation lines – Attribute encoding**

Figure 15-5 – Navigation lines – Geometry encoding

**Remarks:**

- The attribute **depth range minimum value** is used to encode the shallowest depth along the track, where required.
- The attribute **maximum permitted draught** is used to encode the maximum draught permitted on the track, where required.
- The recommended track is that portion of a navigation line (see clause 15.3) that a ship should use for navigation (see Figure 15-5 above).
- In the case of a two-way recommended track, only one value of orientation is encoded (in the mandatory attribute **orientation value**); the other value can be deduced (that is, the value in **orientation value** + 180 degrees). The value of orientation encoded on **orientation value** should be the value of the bearing from seaward. If it is not possible to define a seaward direction, the value that is less than 180° should be used.
- When the traffic flow along a recommended track is one way (attribute **traffic flow** = 1, 2 or 3), the resultant direction of the line (accounting for the direction of digitising and any subsequent reversal of the line) associated with the **Recommended Track** must be the same as the direction of the traffic flow, in order to ensure the correct representation in the Inland ECDIS or ECS of the direction to be followed.

**Distinction:** Fairway; Navigation Line; Recommended Route Centreline; Recommended Traffic Lane Part.

**Inland specific Encoding Instructions:**

- Line should follow known safe and optimal route used by commercial vessels. If no such route is known, the deepest area within the channel, current patterns, and any obstructions to navigation should be considered.
- The **Recommended Track** is that portion of a **Navigation Line** that a ship should use for navigation.
- US: CATTRK always = 2 (not based on a system of fixed marks)  
ORIENT always = "unknown"
- US: A second **Recommended Track** should be used only if needed for routing through an alternate lock, or around a lock, if warranted. Primary and secondary **Recommended Track**

must be distinguished with **information** (INFORM) attribute, and use of **Sea Area** (SEAARE) feature for labelling.

- E) EUR: If a recommended track exists, it must be encoded.

## 15.5 Fairway

**IHO Definition: FAIRWAY.** That part of a river, harbour and so on, where the main navigable channel for vessels of larger size lies. It is also the usual course followed by vessels entering or leaving harbours, called “ship channel”. (International Maritime Dictionary, 2<sup>nd</sup> Edition).

For IENCs the part of the navigable waterway area where a certain water depth within a certain width is available for the continuous navigation.

### **S-401 Geo Feature: Fairway (FAIRWY) (C)**

#### **Primitives: Surface**

† Complex attribute **feature name**, sub-attribute **name usage** is mandatory if the name is intended to be displayed when display of names is enabled by the boatmaster. See clause 2.5.8.

For each instance of **fixed date range**, at least one of the sub-attributes **date end** or **date start** must be populated.

For each instance of **information**, at least one of the sub-attributes **file reference** or **text** must be populated.

### 15.5.1 Fairways

A fairway, sometimes called Ship Channel, is the main navigable channel in the approaches to, or within, a river or harbour. Fairways which are designated by a regulatory authority are treated as Routeing Measures.

If it is required to encode a fairway, it must be done using the feature **Fairway**.

#### Remarks:

- The attribute **depth range minimum value** is used to encode the shallowest depth in the fairway, where known.
- The attribute **maximum permitted draught** is permitted on **Fairway** only where the **Fairway** defines the entire system (that is, the **Fairway** has not been associated with other **Fairway** features and the feature **Fairway System** (see clause 15.6) to define a complete fairway system).
- For additional guidance regarding the encoding of vessel speed limits, see clause 17.4.
- Where beacons or buoys marking a fairway are offset from the actual fairway limits, this should be indicated using the complex attribute **information** (see clause 2.4.6).
- To encode a complete fairway system, the **Fairway** features may be associated with the feature **Fairway System** using the association **Fairway Aggregation** (see clause 25.5). The navigational aids features defining a fairway section may be associated with the **Fairway** using the association **Fairway Auxiliary** (see clause 25.6). Where it is required to indicate the name of a complete fairway system, this should be done using the complex attribute **feature name** for the **Fairway System** feature; or on a single **Fairway** feature where this feature defines the entire system. Where it is required to encode textual information for the fairway system, this should be done using the complex attribute **information**.

Distinction: Traffic Separation Scheme Lane Part.

#### Inland specific Encoding Instructions:

- The fairway has to be encoded if there is one.
- A publication is only allowed if the competent authority has verified its location.
- The **Fairway** must be covered by **Depth Areas**.
- Depth range minimum value** (DRVAL1) of the **Fairway** (FAIRWY) should be used to provide the guaranteed depth of the water within the fairway. **Depth Areas** shall be used to provide actual depth values in addition to **Fairway** (FAIRWY) (refer to 11.6)
- If no detailed bathymetry is available, the **Fairway** shares the geometry of a **Depth Area** with **depth range minimum value** (DRVAL1) = official water depth in metres issued by the competent authority and **depth range maximum value** (DRVAL2) = "unknown"; please refer to 11.6.
- If no detailed bathymetry is available, on each side of the **Fairway** there must be a **Depth Area** between the shoreline and the boundary of the **Fairway** with **depth range minimum value** (DRVAL1) = 0 or "unknown" and **depth range maximum value** (DRVAL2) = official water depth in metres issued by the competent authority; please refer to 11.6)
- If there is a fairway separation with a one-way regulation a two-way route part (refer to 15.8) has to be encoded..

## 15.6 Fairway system

**IHO Definition: FAIRWAY SYSTEM.** That part of a river, harbour and so on, where the main navigable channel for vessels of larger size lies. It is also the usual course followed by vessels entering or leaving harbours, called “ship channel”. (International Maritime Dictionary, 2<sup>nd</sup> Edition).

A fairway system is an aggregation of connected fairway features making up a complex fairway system.

### **S-401 Geo Feature: Fairway System (C\_AGGR) (O)**

† Complex attribute **feature name**, sub-attribute **name usage** is mandatory if the name is intended to be displayed when display of names is enabled by the boatmaster. See clause 2.5.8.

For each instance of **fixed date range**, at least one of the sub-attributes **date end** or **date start** must be populated.

For each instance of **information**, at least one of the sub-attributes **file reference** or **text** must be populated.

### 15.6.1 Fairway systems

A fairway, sometimes called Ship Channel, is the main navigable channel in the approaches to, or within, a river or harbour. Fairways which are designated by a regulatory authority are treated as Routeing Measures.

A fairway system is composed of two or more **Fairway** features that comprise a complex fairway routing system, for instance a long fairway comprising several bends. To define the complete fairway system, the **Fairway** features must be aggregated in a **Fairway System** feature, using the association **Fairway Aggregation** (see clause 25.5).

#### Remarks:

- The name of the complete fairway system must be populated using the complex attribute **feature name**. Where it is required for the name to be displayed in the Inland ECDIS or ECS, the **Fairway System** must be encoded using surface geometry. The extent of the geometry of the **Fairway System** should utilise the geometry of the components of the system so as to cover its full extent.

- All features comprising a fairway system must have the same value populated for the attribute **scale minimum** (see clause 2.5.9).
- Where it is required to populate textual information for the fairway system, this should be done using the complex attribute **information** (see clause 2.4.6), or if the information is considered essential for safe navigation, using a **Caution Area** feature (see clause 16.11).

Distinction: Traffic Separation Scheme; Two-Way Route.

Inland specific Encoding Instructions:

---.

## 15.7 Recommended route centreline

**IHO Definition:** **RECOMMENDED ROUTE CENTRELINE.** The recommended route centreline indicates the “centreline” of a recommended route. (S-57 Edition 3.1, Appendix A – Chapter 1, Page 1.137, November 2000).

### **S-401 Geo Feature: Recommended Route Centreline (RCRTCL) (O)**

#### **Primitives: Curve**

| -                     | <b>Additional Information</b> (see clause 25.1) | <b>Nautical Information</b> | Association | 0,*          |
| -                     | <b>Spatial Association</b> (see clause 25.10)   | <b>Spatial Quality</b>      | Association | 0,*          |

† Complex attribute **feature name**, sub-attribute **name usage** is mandatory if the name is intended to be displayed when display of names is enabled by the boatmaster. See clause 2.5.8.

For each instance of **fixed date range**, at least one of the sub-attributes **date end** or **date start** must be populated.

For each instance of **information**, at least one of the sub-attributes **file reference** or **text** must be populated.

#### 15.7.1 Recommended routes

A recommended route is a route of undefined width, for the convenience of ships in transit, which is often marked by centreline buoys. (IMO Ships Routeing, 2010). IMO-designated recommended routes are listed in IMO publication “*Ships’ Routeing*” Part E. This type of routeing measure was adopted to include such features as the “transit routes” (through former minefields) in the entrances to the Baltic Sea. In contrast to recommended tracks (see clause 15.4), there is usually ample sea-room for vessels to keep well starboard (to the right) of the centreline.

If it is required to encode the centreline of a recommended route, it must be done using the feature **Recommended Route Centreline**.

Remarks:

- The attribute **depth range minimum value** is used to encode the shallowest depth on the route, where known.
- In the case of a recommended route centreline, only one value of orientation is encoded (in the attribute **orientation value**); the other value can be deduced (that is, the value in **orientation value** + 180 degrees). The value of orientation encoded on **orientation value** should be the value of the bearing from seaward. If it is not possible to define a seaward direction, the value that is less than 180° should be used.
- When the traffic flow is one way (attribute **traffic flow** = 1, 2 or 3), the resultant direction of the line (accounting for the direction of digitising and any subsequent reversal of the line) associated with the **Recommended Route Centreline** must be the same as the direction of traffic flow, in order to ensure the correct representation in the Inland ECDIS or ECS of the direction to be followed.

Distinction: Recommended Track; Recommended Traffic Lane Part.

Inland specific Encoding Instructions:

---

## 15.8 Two-way route part

**IHO Definition: TWO-WAY ROUTE PART.** An area of a two-way route within which traffic flow is generally along one bearing (and possibly its reciprocal). (S-57 Edition 3.1, Appendix A – Chapter 1, Page 1.193, November 2000).

For IENCs a two-way route part is either for the entire area, or a part of an area where the traffic flow is restricted to one-way.

† For each instance of **fixed date range**, at least one of the sub-attributes **date end** or **date start** must be populated.

For each instance of **information**, at least one of the sub-attributes **file reference** or **text** must be populated.

Complex attribute **feature name**, sub-attribute **name usage** is mandatory if the name is intended to be displayed when display of names is enabled by the boatmaster. See clause 2.5.8.

### 15.8.1 Two-way Routes

A two way route is a route within defined limits inside which two way traffic is established, aimed at providing safe passage of ships through waters where navigation is difficult or dangerous (IMO Ships Routeing, 2010). It consists of one or more areas within which traffic flows in two directions along one bearing and/or its reciprocal. Such routes are established by regulatory authorities and may be adopted by IMO. IMO-designated two-way routes are listed in IMO publication “*Ships’ Routeing*” Part E. When it is required to encode these areas, this must be done using the feature **Two-Way Route Part**. These route parts will generally be two-way, but some may be restricted to one-way traffic flow.

**Figure 15-6 – One-way traffic flow in a two-way route**

If it is required to encode a two-way route with one-way sections, separate **Two-Way Route Part** features must be encoded for the different parts, with attribute **traffic flow** = 3 (one-way) or 4 (two-way). In one-way sections, the mandatory attribute **orientation value** must indicate the true direction of traffic flow, not its reciprocal. In two-way sections, **orientation value** may indicate either direction of traffic flow.

**Remarks:**

- The orientation of the two-way route part is defined by the centreline of the part and is related to the general direction of the two-way route.
- The attribute **depth range minimum value** is used to encode the shallowest depth on the part, where required.
- To encode a complete Two-way route, the **Two-Way Route Part** features must be associated with the feature **Two-Way Route** (see clause 15.9) using the association **Two-Way Route Aggregation** (see clause 25.15). Where it is required to indicate the name of a complete two-way route, this should be done using the complex attribute **feature name** for the **Two-Way Route** feature. Where it is required to encode textual information for the complete two-way route, this should be done using the complex attribute **information** (see clause 2.4.6) for the **Two-Way Route** feature.
- All **Two-Way Route Part** features comprising a complete two-way route must have the same value populated for the attribute **scale minimum** (see clause 2.5.9).
- Two-way routes may be included with other routeing measures such as traffic separation schemes to comprise a complete traffic routeing system. To encode the relationship between routeing measures, the feature defining each routeing measure within the system (or the relevant feature if the routeing measure consists of a single feature) may be associated with the feature **Traffic Separation Scheme** (see clause 15.17) using the **Traffic Separation Scheme Aggregation** (see clause 25.14) to form a hierarchical relationship. The individual elements comprising different routeing measures must not be collected into a single **Traffic Separation Scheme** feature.

**Distinction:** Recommended Traffic Lane Part; Traffic Separation Scheme Lane Part.

**Inland specific Encoding Instructions:**

- A) The **Two-Way Route Parts** in front and behind of a bridge must be at least 200 m long.
- B) To avoid the symbolization of the boundary of a two-way route part at the borderline between two cells, the edge may be masked.

## 15.9 Two-way route

**IHO Definition: TWO-WAY ROUTE.** A route within defined limits inside which two way traffic is established, aimed at providing safe passage of ships through waters where navigation is difficult or dangerous. (IMO Ships' Routeing).

† Complex attribute **feature name**, sub-attribute **name usage** is mandatory if the name is intended to be displayed when display of names is enabled by the boatmaster. See clause 2.5.8.

For each instance of **fixed date range**, at least one of the sub-attributes **date end** or **date start** must be populated.

For each instance of **information**, at least one of the sub-attributes **file reference** or **text** must be populated.

#### 15.9.1 Two-way routes

To define the complete two-way system, the **Two-Way Route Part** features must be aggregated with a **TwoWay Route** feature using the association **Two-Way Route Aggregation**.

##### Remarks:

- The name of the two-way route, where required, must be populated using the complex attribute **feature name**. Where it is required for the name to be displayed in the Inland ECDIS or ECS, the **Two-Way Route** must be encoded using surface geometry. The extent of the geometry of the **Two-Way Route** should utilise the geometry of the components of the route so as to cover its full extent.
- All features comprising a two-way route must have the same value populated for the attribute **scale minimum** (see clause 2.5.9).
- Where it is required to populate textual information for the two-way route, this should be done using the complex attribute **information** (see clause 2.4.6) for the **Two-Way Route**; or if the information is considered essential for safe navigation, using a **Caution Area** feature (see clause 16.11).

Distinction: Fairway System; Traffic Separation Scheme; Two-Way Route Part.

##### Inland specific Encoding Instructions:

---

## 15.10 Recommended traffic lane part

**IHO Definition:** **RECOMMENDED TRAFFIC LANE PART.** A traffic flow pattern indicating a recommended directional movement of traffic where it is impractical or unnecessary to adopt an established direction of traffic flow. (IMO Ships' Routeing).

### **S-401 Geo Feature: Recommended Traffic Lane Part (RCTLPT) (O)**

**Primitives:** Point, Surface

† For each instance of **fixed date range**, at least one of the sub-attributes **date end** or **date start** must be populated.

For each instance of **information**, at least one of the sub-attributes **file reference** or **text** must be populated.

Complex attribute **feature name**, sub-attribute **name usage** is mandatory if the name is intended to be displayed when display of names is enabled by the boatmaster. See clause 2.5.8.

#### 15.10.1 Recommended traffic lane part

Recommended direction of traffic flow is a traffic flow pattern indicating a recommended directional movement of traffic where it is impractical or unnecessary to adopt an established direction of traffic flow. (IMO Ships Routeing, 2010). IMO-designated recommended directions of traffic flow are listed in IMO publication “*Ships’*

*Routeing*” Part E. Several hydrographic offices, in consultation with their Ministries of Transport, have added recommended directions in areas such as the outer approaches to major ports in order to show the best routes for crossing traffic or to minimise the risk of head-on encounters.

The feature **Recommended Traffic Lane Part** must be used, where required, to encode areas with a recommended direction of traffic flow which is generally along one bearing:

- between two traffic separation schemes (TSS);
- in the entrance area of a TSS.

#### Remarks:

- When the area is not defined, a point feature should be encoded.
- The orientation of the recommended traffic lane part is defined by the centreline of the part and is related to the general direction of traffic flow in the recommended traffic lane.

#### Distinction:

#### Inland specific Encoding Instructions:

---

## 15.11 Inshore traffic zone

**IHO Definition: INSHORE TRAFFIC ZONE.** A routeing measure comprising a designated area between the landward boundary of a traffic separation scheme and the adjacent coast, to be used in accordance with the provisions of the International Regulations for Preventing Collisions at Sea. (Adapted from IMO Ships' Routeing).

### **S-401 Geo Feature: Inshore Traffic Zone (ISTZNE) (M)**

#### **Primitives: Surface**

† For each instance of **fixed date range**, at least one of the sub-attributes **date end** or **date start** must be populated.

For each instance of **information**, at least one of the sub-attributes **file reference** or **text** must be populated.

Complex attribute **feature name**, sub-attribute **name usage** is mandatory if the name is intended to be displayed when display of names is enabled by the boatmaster. See clause 2.5.8.

#### 15.11.1 Inshore traffic zones

The feature **Inshore Traffic Zone** must only be used to encode the designated area between the landward boundary of a traffic separation scheme and the adjacent coast.

Remarks:

- For additional guidance regarding the encoding of vessel speed limits, see clause 17.4.
- Inshore traffic zones are used to exclude most classes of through traffic. Traffic in an inshore traffic zone is separated from traffic in the adjacent traffic lane by a separation zone or line (see clause 15.14). An inshore traffic zone may be adjacent to a precautionary area (see clause 15.12).

Distinction: Precautionary Area; Separation Zone or Line; Traffic Separation Scheme Crossing; Traffic Separation Scheme Lane Part.

Inland specific Encoding Instructions:

---

## 15.12 Precautionary area

**IHO Definition: PRECAUTIONARY AREA.** A routeing measure comprising an area within defined limits where ships must navigate with particular caution and within which the direction of traffic flow may be recommended. (IMO Ships' Routeing).

### **S-401 Geo Feature: Precautionary Area (PRCARE) (M)**

† Complex attribute **feature name**, sub-attribute **name usage** is mandatory if the name is intended to be displayed when display of names is enabled by the boatmaster. See clause 2.5.8.

For each instance of **fixed date range**, at least one of the sub-attributes **date end** or **date start** must be populated.

For each instance of **information**, at least one of the sub-attributes **file reference** or **text** must be populated.

#### 15.12.1 Precautionary areas

Precautionary areas are commonly designated by IMO for certain areas of converging or crossing traffic, usually in association with traffic separation schemes. If it is required to encode such areas, it must be done using the feature **Precautionary Area**.

##### Remarks:

- To encode the relevant cautionary information, this must be done using the complex attribute **information** (see clause 2.4.6).
- For additional guidance regarding the encoding of vessel speed limits, see clause 17.4.
- A **Precautionary Area** feature may overlap other features encoded for the traffic separation scheme (for example **Traffic Separation Scheme Lane Part**, **Traffic Separation Scheme Crossing**).
- Where a **Precautionary Area** feature is included in the association **Traffic Separation Scheme Aggregation**, the attribute **IMO adopted** must not be populated for the **Precautionary Area** feature.

Distinction: Caution Area; Inshore Traffic Zone; Restricted Area; Separation Zone or Line; Traffic Separation Scheme Boundary; Traffic Separation Scheme Crossing; Traffic Separation Scheme Lane Part; Two-Way Route Part.

##### Inland specific Encoding Instructions:

---

### 15.13 Traffic separation scheme lane part

**IHO Definition:** **TRAFFIC SEPARATION SCHEME LANE PART.** An area within defined limits in which oneway traffic is established. Natural obstacles, including those forming separation zones, may constitute a boundary. (IHO Dictionary – S-32).

**S-401 Geo Feature: Traffic Separation Scheme Lane Part (TSSLPT) (O)**

**Primitives: Surface**

† The attribute **orientation value** is mandatory for all **Traffic Separation Scheme Lane Part** features, unless the part is a junction.

For each instance of **fixed date range**, at least one of the sub-attributes **date end** or **date start** must be populated.

For each instance of **information**, at least one of the sub-attributes **file reference** or **text** must be populated.

Complex attribute **feature name**, sub-attribute **name usage** is mandatory if the name is intended to be displayed when display of names is enabled by the boatmaster. See clause 2.5.8.

#### 15.13.1 Traffic separation scheme lanes

A traffic lane is an area within defined limits in which one-way traffic flow is established. Natural obstacles, including those forming separation zones, may constitute a boundary. (IHO Dictionary – S-32). A complete traffic separation scheme lane consists of one or more areas within which the flow of traffic follows one defined direction. If it is required to encode these areas, this must be done using the feature **Traffic Separation Scheme Lane Part**.

#### Remarks:

- At junctions, other than crossings, a separate **Traffic Separation Scheme Lane Part** feature must be encoded. For this feature, the attribute **orientation value** must be omitted, in order to avoid implying that one lane has priority over another (see INT1 – M22). Warning text may be encoded using the complex attribute **information** (see clause 2.4.6). In some cases, a precautionary area is established where routes meet or cross (see clause 15.12.1).

**Figure 15-7 – Junction**

- The orientation of the traffic separation scheme lane part is defined by the centreline of the part and is related to the general direction of traffic flow in the traffic separation lane.
- For additional guidance regarding the encoding of vessel speed limits, see clause 17.4.

Distinction: Recommended Traffic Lane Part; Separation Zone or Line; Traffic Separation Scheme Boundary; Traffic Separation Scheme Crossing.

Inland specific Encoding Instructions:

---

## 15.14 Separation zone or line

**IHO Definition: SEPARATION ZONE OR LINE.** A zone or line separating the traffic lanes in which ships are proceeding in opposite, or nearly opposite directions; or separating a traffic lane from an adjacent sea area; or separating traffic lanes designated for particular classes of ships proceeding in the same direction. (IHO Dictionary – S-32).

For each instance of **information**, at least one of the sub-attributes **file reference** or **text** must be populated.

Complex attribute **feature name**, sub-attribute **name usage** is mandatory if the name is intended to be displayed when display of names is enabled by the boatmaster. See clause 2.5.8.

#### 15.14.1 Separation zones and lines

The feature **Separation Zone or Line** must be used to encode the common boundary or separation areas between routeing measures as specified in IMO Ships' Routeing.

Remarks:

- No remarks.

Distinction: Traffic Separation Scheme Boundary; Traffic Separation Scheme Crossing; Traffic Separation Scheme Lane Part.

Inland specific Encoding Instructions:

- A) If a structured external XML-file with more detailed communication information is available, the reference to the file has to be entered in the **file reference** (TXTDSC) attribute.
- B) Use **status** (STATUS) if any of the conditions apply.
- C) EUR: Traffic Separation Zones must be encoded.

## 15.15 Traffic separation scheme boundary

**IHO Definition:** **TRAFFIC SEPARATION SCHEME BOUNDARY.** The outer limit of a traffic lane part or a traffic separation scheme roundabout. (S-57 Edition 3.1, Appendix A – Chapter 1, Page 1.185, November 2000).

### **S-401 Geo Feature:** Traffic Separation Scheme Boundary (TSSBND) (O)

#### **Primitives:** Curve

† For each instance of **fixed date range**, at least one of the sub-attributes **date end** or **date start** must be populated.

For each instance of **information**, at least one of the sub-attributes **file reference** or **text** must be populated.

Complex attribute **feature name**, sub-attribute **name usage** is mandatory if the name is intended to be displayed when display of names is enabled by the boatmaster. See clause 2.5.8.

#### 15.15.1 Traffic separation scheme boundaries

The feature **Traffic Separation Scheme Boundary** must only be used to encode the outer limits of traffic lanes.

Remarks:

- **Traffic Separation Scheme Boundary** must not be used to encode the boundary between a traffic separation scheme lane and a traffic separation zone; or a traffic separation zone and an inshore traffic zone.

Distinction: Separation Zone or Line; Traffic Separation Scheme Crossing; Traffic Separation Scheme Lane Part.

Inland specific Encoding Instructions:

---

## 15.16 Traffic separation scheme crossing

IHO Definition: **TRAFFIC SEPARATION SCHEME CROSSING.** A defined area where traffic lanes cross. (S57 Edition 3.1, Appendix A – Chapter 1, Page 1.186, November 2000).

### S-401 Geo Feature: Traffic Separation Scheme Crossing (TSSCRS) (O)

### Feature Associations

| S-401 Role         | Association Type                                                | Associated to                    | Type        | Multiplicity |
|--------------------|-----------------------------------------------------------------|----------------------------------|-------------|--------------|
| The Component      | <b>Traffic Separation Scheme Aggregation</b> (see clause 25.14) | <b>Traffic Separation Scheme</b> | Association | 0,*          |
| The Updated Object | <b>Updated Information</b> (see clause 25.16)                   | <b>Update Information</b>        | Association | 0,*          |
| -                  | <b>Additional Information</b> (see clause 25.1)                 | <b>Nautical Information</b>      | Association | 0,*          |
| -                  | <b>Spatial Association</b> (see clause 25.10)                   | <b>Spatial Quality</b>           | Association | 0,*          |

† For each instance of **fixed date range**, at least one of the sub-attributes **date end** or **date start** must be populated.

For each instance of **information**, at least one of the sub-attributes **file reference** or **text** must be populated.

Complex attribute **feature name**, sub-attribute **name usage** is mandatory if the name is intended to be displayed when display of names is enabled by the boatmaster. See clause 2.5.8.

#### 15.16.1 Traffic separation scheme crossing

The feature **Traffic Separation Scheme Crossing** must only be used to encode the area where at least four traffic lanes cross.

##### Remarks:

- For additional guidance regarding the encoding of vessel speed limits, see clause 17.4.
- Junctions other than crossings should be encoded using the feature **Traffic Separation Scheme Lane Part** (see clause 15.13).
- A **Traffic Separation Scheme Crossing** feature must not overlap a **Separation Zone or Line** feature of type surface at its centre.
- In some cases, a precautionary area is established where routes meet or cross (see clause 15.12.1).

Distinction: Separation Zone or Line; Traffic Separation Scheme Boundary; Traffic Separation Scheme Lane Part.

#### Inland specific Encoding Instructions:

---

## 15.17 Traffic separation scheme

**IHO Definition:** **TRAFFIC SEPARATION SCHEME.** A routeing measure aimed at the separation of opposing streams of traffic by appropriate means and by the establishment of traffic lanes. (IHO Dictionary – S-32).

### **S-401 Geo Feature: Traffic Separation Scheme (M)**

#### **Primitives: Surface, No Geometry**

† Complex attribute **feature name**, sub-attribute **name usage** is mandatory if the name is intended to be displayed when display of names is enabled by the boatmaster. See clause 2.5.8.

For each instance of **fixed date range**, at least one of the sub-attributes **date end** or **date start** must be populated.

For each instance of **information**, at least one of the sub-attributes **file reference** or **text** must be populated.

### 15.17.1 Traffic separation schemes

If it is required to encode a traffic separation scheme (TSS), it must be done using:

- **Inshore Traffic Zone** (see clause 15.11);
- **Precautionary Area** (see clause 15.12);
- **Separation Zone or Line, Traffic Separation Scheme Boundary, Traffic Separation Scheme Crossing, Traffic Separation Scheme Lane Part**(see clauses 15.13 to 15.17); and
- Navigational aids features (see Sections 18 to 21).

To define the complete traffic separation scheme system, these features must be associated with the feature **Traffic Separation Scheme** using the association **Traffic Separation Scheme Aggregation** (see clause 25.14); and any associated aids to navigation should be associated with the **Traffic Separation Scheme** using the association **Aids to Navigation Association** (see clause 25.2).

#### Remarks:

- The name of the TSS must be populated using the complex attribute **feature name**. Where it is required for the name to be displayed in the Inland ECDIS or ECS, the **Traffic Separation Scheme**

must be encoded using surface geometry. The extent of the geometry of the **Traffic Separation Scheme** should utilise the geometry of the components of the scheme so as to cover its full extent.

- Where it is required to encode an IMO declared Area to be Avoided within a TSS, this must be done using the feature **Restricted Area** (see clause 17.8), with attribute **restriction** = 14 (area to be avoided).
- Where it is required to populate textual information for the TSS, this should be done using the complex attribute **information** (see clause 2.4.6) for the **Traffic Separation Scheme**; or if the information is considered essential for safe navigation, using a **Caution Area** feature (see clause 16.11).
- All features comprising a traffic separation scheme must have the same value populated for the attribute **scale minimum** (see clause 2.5.9).
- Multiple **Traffic Separation Scheme** features may be further aggregated hierarchically using the association **Traffic Separation Scheme Aggregation** to define a higher TSS.

Distinction: Fairway System; Two-Way Route.

Inland specific Encoding Instructions:

---

## 15.18 Radio calling-in point

**IHO Definition:** **RADIO CALLING-IN POINT.** A designated position at which vessels are required to report to a Traffic Control Centre. Also called reporting point or radio reporting point. (IHO Dictionary – S-32).

### **S-401 Geo Feature: Radio Calling-In Point (rdocal) (M)**

#### **Primitives: Point, Curve**

| The Component         | <b>Tunnel Aggregation</b> (see clause 25.27)    | <b>Tunnel</b>                                                                        | Association | 0,*          |
| The Updated Object    | <b>Updated Information</b> (see clause 25.16)   | <b>Update Information</b>                                                            | Association | 0,*          |
| The Position Provider | <b>Text Association</b> (see clause 25.13).     | <b>Text Placement</b>                                                                | Composition | 0,1          |
| -                     | <b>Additional Information</b> (see clause 25.1) | <b>Contact Details, NonStandard Working Day, Service Hours, Nautical Information</b> | Association | 0,*          |
| -                     | <b>Spatial Association</b> (see clause 25.10)   | <b>Spatial Quality</b>                                                               | Association | 0,*          |

Complex attribute **feature name**, sub-attribute **name usage** is mandatory if the name is intended to be displayed when display of names is enabled by the boatmaster. See clause 2.5.8.

For each instance of **fixed date range**, at least one of the sub-attributes **date end** or **date start** must be populated.

For each instance of **information**, at least one of the sub-attributes **file reference** or **text** must be populated.

#### 15.18.1 Radio calling-in (reporting) points

Radio reporting points, also called radio calling-in points, have been established in certain busy waterways and port approaches to assist traffic control. On passing these points or crossing a defined line vessels are required to report on VHF to a Traffic Control Centre.

If it is required to encode a radio reporting point or line, it must be done using the feature **Radio Calling-In Point**.

#### Remarks:

- Each **Radio Calling-In Point** feature of type point must carry at least one orientation, using the attribute **orientation value**. If it is required to encode the reciprocal orientation, to indicate that a bearing and its opposite apply to a **Radio Calling-In Point** feature, it must be done using attribute

**traffic flow** = 4 (two-way). If the same position is used for another orientation (not opposite) of traffic flow, a second **orientation value** attribute must be encoded.

- The complex attribute **feature name**, sub-attribute **name** is used to encode the name and/or alphanumeric designator of the **Radio Calling-In Point**.
- The complex attribute **information** (see clause 2.4.6) is used to provide additional information, where required. For example, if the requirement to report by radio relates to certain classes of vessels only.
- **Radio Calling-In Point** features of type curve must be encoded such that resultant direction of the line (accounting for the direction of digitising and any subsequent reversal of the curve) is related such that the direction of traffic that is required to report is to the right.
- If it is required to encode the area of a Vessel Traffic Service (VTS) containing radio reporting points or requiring periodic position reporting, this should be done using the feature **Vessel Traffic Service Area** (see clause 22.2).
- Each VHF-channel should be indicated using the attribute **communication channel** (see clause 27.107). Alternately, if the same VHF-channel(s) apply to multiple features in the dataset, this should be indicated through an associated instance of the information type **Contact Details**, attribute **communication channel** (see clause 24.1).

Distinction: Radio Station; Pilot Boarding Place; Vessel Traffic Service Area.

Inland specific Encoding Instructions:

- A) If it's not a one-way route use **traffic flow** (TRAFIC) = 4 two-way in general. Use inbound (upstream) and outbound (downstream), if the obligation to report applies only to one direction of traffic.
- B) The attribute **orientation value** (ORIENT) is used to point in the direction of impact and enables to fix the pointer of the symbol
- C) **communication channel** (COMCHA) has to be used. The attribute "communication channel" encodes the various VHF-channels used for communication. Each VHF-channel should be indicated by 2 digits and can have up to 2 additional characters (A-Z); e.g., VHF-channel 7 -> 07', VHF-channel 16 -> >16'; The indication of several VHF-channels is possible.
- D) 'catcom' should always be used.
- E) The use of curve features crossing the waterway is preferred, but it is not allowed to encode two different **Radio calling-in (reporting) points** (rdocal) features on the same curve.
- F) If a structured external XML-file with more detailed communication information is available, the reference to the file has to be entered in the **file reference** (TXTDSC) attribute.
- G) If there is a reporting duty at a specific point/line use **Radio Calling-In Point** (rdocal) feature. (Refer to 15.18)
- H) EUR: If the ISRS Location Code is available, it has to be encoded (see 2.4.13). If a maritime MRN or RIS-ID is available, the attribute **interoperability identifier** must be encoded (refer to **Fehler! Verweisquelle konnte nicht gefunden werden.**).

## 15.19 Ferry route

**IHO Definition: FERRY ROUTE.** A route in a body of water where a ferry crosses from one shoreline to another. (Defence Geospatial Information Working Group; Feature Data Dictionary Register, 2010).

† Complex attribute **feature name**, sub-attribute **name usage** is mandatory if the name is intended to be displayed when display of names is enabled by the boatmaster. See clause 2.5.8.

For each instance of **fixed date range**, at least one of the sub-attributes **date end** or **date start** must be populated.

For each instance of **information**, at least one of the sub-attributes **file reference** or **text** must be populated.

### 15.19.1 Ferries

Ferry routes should be encoded on the largest optimum display scale IENC datasets:

- where they cross fairly narrow channels, in order that through traffic is warned of their existence;
- where the ferry tracks are short enough to be reasonably accurately represented; and

- on IENCs used for harbour navigation, as part of the general information about the area.

If it is required to encode a ferry route, it must be done using the feature **Ferry Route**.

Remarks:

- Long distance ferries which have routes varying with weather, tide and traffic should not generally be encoded, although the terminals should be shown on appropriate optimum display scale IENC datasets, using the feature **Harbour Facility** (see clause 22.7), with attribute **category of harbour facility** = 1 (RoRo-terminal) or 3 (ferry terminal).

Distinction:

Inland specific Encoding Instructions:

- A) Code the route that connects the docks or mooring facilities used by the ferry.
- B) The route should be the path officially permitted by the relevant authority. If no such official designation exists, use the route typically used by the ferry vessel(s).
- C) Use **status** (STATUS) if any of the conditions apply.
- D) A ferry may use a high water route and low water route. Label in **information text** (INFORM) as "Used for Low Water" and "Used for High Water"
- E) If the ferry has a special time schedule or special operating hours apply, the object can be combined with a time schedule. For this purpose refer to the **Time Schedule (General)** feature 'tisdge' see 24.6
- F) If a structured external XML-file with more detailed communication information is available, the reference to the file has to be entered in the **file reference** (TXTDSC) attribute.
- G) EUR: If the ISRS Location Code is available, It must be encoded (refer to 2.4.13). If a maritime MRN or RIS-ID is available, the attribute **interoperability identifier** must be encoded (refer to **Fehler! Verweisquelle konnte nicht gefunden werden.**).
- H) Cable ferries (either assisted by propulsion or not) are fixed to a cable. This cable is crossing the river either above or below water surface
  - i) If the ferry is connected to a leading cable, which crosses the fairway above the water surface, this cable shall be encoded as an overhead cable.
- I) A swinging wire ferry is a route in a body of water where a ferry crosses from one shoreline to another. A "Swinging Wire Ferry" is connected to a fixed point (e.g., an anchor in the middle of the waterway) and swings around this point from shore to shore via a cable to an anchor. The cable runs more or less parallel to the current. (Digital Geographic Information Working Group, Oct.87)
  - i) Use **Special Purpose/General Buoy** with **category of special purpose mark** (CATSPM) =37 (ferry crossing mark) to encode the supporting pontoons.
  - ii) For the cable between the ferry and the fixed point (e.g. anchor, mast) use a **Cable Area** (CBLARE) (not a **Cable Submarine** (CBLSUB) or **Cable Overhead** (cblohd)), as the position of the cable changes during the ride.
- J) Free moving ferry
  - i) If an officially designated route exists and a free moving ferry is crossing the waterway and not following the traffic flow it must be encoded.

## 15.20 Radar line

**IHO Definition: RADAR LINE.** Recommended tracks along which ships can be guided by coastal radar stations in the event of bad visibility. (IHO Dictionary – S-32).

### **S-401 Geo Feature: Radar Line (RADLNE) (O)**

#### **Primitives: Curve**

| -                     | <b>Spatial Association</b> (see clause 25.10)   | <b>Spatial Quality</b>      | Association | 0,*          |

† Complex attribute **feature name**, sub-attribute **name usage** is mandatory if the name is intended to be displayed when display of names is enabled by the boatmaster. See clause 2.5.8.

For each instance of **information**, at least one of the sub-attributes **file reference** or **text** must be populated.

**15.20.1 Radar reference lines**

Radar reference lines are mid-channel lines corresponding to lines incorporated in Vessel Traffic Services (VTS) radar displays. A line is used as a positional reference so that the VTS authorities may easily provide a vessel with its position, relative to the line, when visibility is poor. These must be charted on appropriate optimum display scale IENC data.

If it is required to encode a radar reference line, it must be done using the feature **Radar Line**.

**Remarks:**

- The value of orientation encoded on the mandatory attribute **orientation value** should be the value of the bearing from seaward. If it is not possible to define a seaward direction, the value that is less than 180° should be used.
- If it is required to encode the area of a VTS containing radar lines, this should be done using the feature **Vessel Traffic Service Area** (see clause 22.2).

**Distinction:** Radar Range; Recommended Track; Vessel Traffic Service Area.

**Inland specific Encoding Instructions:**

---

## 15.21 Radar range

**IHO Definition: RADAR RANGE.** Indicates the coverage of a sea area by a radar surveillance station. Inside this area a vessel may request shore-based radar assistance, particularly in poor visibility. (Adapted from Defence Geospatial Information Working Group; Feature Data Dictionary Register, 2010).

| -                     | <b>Spatial Association</b> (see clause 25.10)   | <b>Spatial Quality</b>                       | Association | 0,*          |

<sup>†</sup> Complex attribute **feature name**, sub-attribute **name usage** is mandatory if the name is intended to be displayed when display of names is enabled by the boatmaster. See clause 2.5.8.

For each instance of **fixed date range**, at least one of the sub-attributes **date end** or **date start** must be populated.

For each instance of **information**, at least one of the sub-attributes **file reference** or **text** must be populated.

**15.21.1 Radar ranges**

Many large ports have a radar surveillance system covering their approaches to provide guidance for vessels, particularly in poor visibility. The maximum range of the system forms an arc or series of overlapping arcs.

If it is required to encode a radar range, it must be done using the feature **Radar Range**.

**Remarks:**

- Each VHF-channel should be indicated, using the attribute **communication channel** (see clause 27.107). Alternately, if the same VHF-channel(s) apply to multiple features in the dataset, this should be indicated through an associated instance of the information type **Contact Details**, attribute **communication channel** (see clause 24.1).

**Distinction:** Radar Line; Vessel Traffic Service Area.

**Inland specific Encoding Instructions:**

---

## 15.22 Radar station

**IHO Definition: RADAR STATION.** A station with a transmitter emitting pulses of ultra-high frequency radio waves which are reflected by solid objects and are detected upon their return to the sending station. (International Maritime Dictionary, 2<sup>nd</sup> Edition).

For IENCs the radar station of a VTS or a lock to locate vessels and/ or monitor the traffic.

### **S-401 Geo Feature: Radar Station (RADSTA) (O)**

### Feature Associations

| S-401 Role            | Association Type                                | Associated to                                | Type        | Multiplicity |
|-----------------------|-------------------------------------------------|----------------------------------------------|-------------|--------------|
| The Updated Object    | <b>Updated Information</b> (see clause 25.16)   | <b>Update Information</b>                    | Association | 0,*          |
| The Position Provider | <b>Text Association</b> (see clause 25.13).     | <b>Text Placement</b>                        | Composition | 0,1          |
| -                     | <b>Additional Information</b> (see clause 25.1) | <b>Contact Details, Nautical Information</b> | Association | 0,*          |
| -                     | <b>Spatial Association</b> (see clause 25.10)   | <b>Spatial Quality</b>                       | Association | 0,*          |

† Complex attribute **feature name**, sub-attribute **name usage** is mandatory if the name is intended to be displayed when display of names is enabled by the boatmaster. See clause 2.5.8.

For each instance of **information**, at least one of the sub-attributes **file reference** or **text** must be populated.

### 15.22.1 Radar station

If it is required to encode a radar station, it must be done using the feature **Radar Station**.

#### Remarks:

- Coast radar stations are shore-based stations which the boatmaster can contact by radio to obtain a position. These stations are being increasingly replaced by other position-fixing methods.
- The **Radar Station** must only be used to encode the technical equipment itself, independent of the building or structure in which it is installed. If it is required to encode the building or structure (for example mast, tower, radar dome) it must be done using an appropriate feature (for example **Building, Landmark**). There is no requirement to establish a Structure/Equipment association between the **Radar Station** feature and the structure in which it is installed.
- The attribute **height** is used to encode the height of the emitting part of the radar, where known.
- Each VHF-channel should be indicated, using the attribute **communication channel** (see clause 27.107). Alternately, if the same VHF-channel(s) apply to multiple features in the dataset, this should be indicated through an associated instance of the information type **Contact Details**, attribute **communication channel** (see clause 24.1).

Distinction: Radar Line; Radar Range; Radar Transponder Beacon.

#### Inland specific Encoding Instructions:

- A) The communication information of the VTS or lock to which the radar antenna belongs should be encoded by a **Communication Area** (comare) feature (22.13).

## 15.23 Waterway Area

| <u>IHO Definition:</u> An area in which uniform general information of the waterway exists. |                           |                                                                                                                                              |        |              |

† Complex attribute **feature name**, sub-attribute **name usage** is mandatory if the name is intended to be displayed when display of names is enabled by the boatmaster. See clause 2.5.8.

Inland specific encoding instructions:

- A) **direction of impact** (dirimp), the orientation of the official distance numbering, is upstream if the official distance numbering increases towards the origin of a river and downstream if the numbering decreases towards the origin of a river. Otherwise, e.g., in case of a canal, downstream is in the direction of the general water flow or to be decided arbitrarily
- B) EUR: If the ISRS Location Code is available, it has to be encoded (refer to 2.4.13). If a maritime MRN or RIS-ID is available, the attribute **interoperability identifier** must be encoded (refer to **Fehler! Verweisquelle konnte nicht gefunden werden.**).

## 15.24 Waterway Axis

**IHO Definition:** The waterway axis can be defined as, for example: - The middle line of a fairway, (Definition of fairway: That part of a river, harbour; etc. where the main navigable channel for vessels of larger size lies. It is also the usual course followed by vessels entering or leaving harbours, called "ship channel". (International Maritime Dictionary, 2nd Ed.)). - The middle line of a water way (Definition of waterway: The waterway covers the entire area of a river or canal).

### **S-401 Geo Feature: Waterway Axis (wtwaxs) (C)**

#### **Super Type:**

#### **Primitives: curve**

† Complex attribute **feature name**, sub-attribute **name usage** is mandatory if the name is intended to be displayed when display of names is enabled by the boatmaster. See clause 2.5.8.

Inland specific encoding instructions:

- A) EUR: The waterway axis must be encoded if an IENC is intended to be used for navigation mode.
- B) If a fairway exists, the middle line of the fairway shall be used to define the waterway axis.
- C) For an update of an existing IENC, if possible, the **Waterway Axis** (wtwaxs) should be based on the middle line of a fairway rather than the middle line of a waterway. (For EU Member States: The replacement of an axis can be done in connection with the fulfilment of the minimum requirements set out in article 4 of the European RIS Directive.)
- D) Ideally, the **Waterway Axis** should be a continuous line that marks, at every position, the middle line of a fairway. If this is not feasible, the axis can be built as a lineal connection between points that show the middle line of the fairway every 100 metres (= 1/10 kilometre) or 1/10 mile, 1/10 sea mile etc.
- E) For distance marks along the waterway axis see 8.10.
- F) In case of two different systems of waterway distances in one area, one of them has to be selected for the waterway axis.

## 15.25 Waterway Profile

**IHO Definition:** A physically non-existent line which is normally the connection of two opposite distance marks. Waterway profiles can be used to define a special water level.

### **S-401 Geo Feature: Waterway Profile (wtwprf) (C)**

#### **Super Type:**

#### **Primitives: curve**

| <p>† Complex attribute <b>feature name</b>, sub-attribute <b>name usage</b> is mandatory if the name is intended to be displayed when display of names is enabled by the boatmaster. See clause 2.5.8.</p> <p><u>Inland specific encoding instructions:</u></p> <p>A) If waterway profiles are used on a waterway, the spacing of the waterway profiles depends on the local slope of the water level. The most common spacing is every one hundred metres. Preferably the location of waterway profiles coincides with distance marks ashore.</p> <p>B) <b>height</b> (HEIGHT) refers to the reference level within the attribute <b>reference gravitational level</b> (reflev).</p> <p>C) If detailed depths for water level model are provided waterway profiles must be encoded in order to be able to assign a <b>waterway distance</b> to the <b>Depth Area</b> (See 11.6 Detailed Depth - water level model).</p> <p>D) Use <b>name of sounding datum reference level</b> (sdrlev) and <b>sounding datum reference level value</b> (sdrval) if the local value and name of vertical river datum reference level (design waterlevel) is known.</p> |                                               |                        |             |     |

## 15.26 Turning Basin

**IHO Definition:** An area of water or enlargement of a channel used for turning vessels.

### **S-401 Geo Feature: Turning Basin (trnbsn) (C)**

#### **Super Type:**

**Primitives:** point, surface

† Complex attribute **feature name**, sub-attribute **name usage** is mandatory if the name is intended to be displayed when display of names is enabled by the boatmaster. See clause 2.5.8.

Inland specific encoding instructions:

- A) Use **Turning Basin** (trnbsn) feature
- B) EUR: If the ISRS Location Code is available it has to be encoded (refer to 2.4.13). If a maritime MRN or RIS-ID is available, the attribute **interoperability identifier** must be encoded (refer to **Fehler! Verweisquelle konnte nicht gefunden werden.**).
- C) EUR: Turning Basins must be encoded.
- D) **horizontal clearance value** (HORCLR) is the width of the basin, which is available for safe navigation. This may, or may not, be the same as the total physical width of the basin.

## 16 Geo Features – Areas, limits

### 16.1 International boundaries and national limits

The United Nations Convention on the Law of the Sea (UNCLOS), 1982 came into force on 16 November 1994. UNCLOS contains navigational provisions as well as provisions for determining the limits of various maritime zones. These provisions are binding to all states that have ratified the Convention. For technical aspects of UNCLOS, see IHO publication C-51.

IHO Member States should show, on selected series of their IENCs, their own baseline and maritime limits in accordance with UNCLOS.

The boatmaster may be interested in the exact location of international boundaries for two principal reasons:

- When crossing a boundary they could be subject to different laws and regulations which may affect their navigation; for example buoyage systems, pilotage regulations, fishing rights, reporting procedures, pollution regulations.
- Where a boundary passes through groups of offshore islands they may wish to know upon which side of the boundary a particular island falls.

### 16.2 Maritime jurisdiction areas

Figure 16-1 – Maritime jurisdiction areas

**Figure 16-2 – Maritime jurisdiction areas in constrained waters**

The clauses in Section 16 below provide guidance for the encoding of jurisdiction areas. Occasionally, these “areas” may actually be defined as linear due to international treaties; or the areas may not be fully defined and it may therefore be necessary to encode the boundary as a linear feature (see example at Figure 16-3 below). Clause 2.3 defining features permitted for use in IENC and their geometric primitives allows relevant feature classes relating to jurisdiction areas to be encoded as type curve; however this must only be done in circumstances where it is not possible to encode the feature using geometric primitive surface.

**Figure 16-3 – Maritime jurisdiction – areas cannot be defined**

In Figure 16-3, Administration Areas A and B cannot be encoded using geometric primitive surface as the seaward edge of the areas is not defined. In this case, the section of the international boundary extending seaward from the low water line should be encoded as an **Administration Area** feature of type curve (see clause 16.9).

### 16.3 Anchorage area

IHO Definition: **ANCHORAGE AREA.** An area in which vessels or seaplanes anchor or may anchor. (Adapted from IHO Dictionary – S-32).

**S-401 Geo Feature: Anchorage Area (achare) (C)**

**Primitives: Point, Surface**

† Complex attribute **feature name**, sub-attribute **name usage** is mandatory if the name is intended to be displayed when display of names is enabled by the boatmaster. See clause 2.5.8.

For each instance of **fixed date range**, at least one of the sub-attributes **date end** or **date start** must be populated.

For each instance of **information**, at least one of the sub-attributes **file reference** or **text** must be populated.

### 16.3.1 Anchorages

Where the limits of anchorages are defined by a regulatory authority (for example harbour authority) they must be shown on the largest optimum display scale IENC data. They may also be shown on other optimum display scale IENC datasets where useful, for example, for planning purposes.

If it is required to encode an anchorage area, including anchorages for seaplanes, it must be done using the feature **Anchorage Area**.

#### Remarks:

- The complex attribute **feature name**, sub-attribute **name** is used to encode the name and/or number of the **Anchorage Area**.
- The complex attribute **information** (see clause 2.4.6) may be used to provide additional information about the category of anchorage, where required.
- Individual recommended anchorages without defined limits should be encoded as **Anchorage Area** features of type point, with attributes **category of anchorage** = 1 (unrestricted anchorage) and **status** = 3 (recommended).

If it is required to encode an anchorage at a location that has not been defined by a regulatory authority but has been reported to be suitable and safe for anchoring, this must be done using **Anchorage Area** of type point, with attribute **category of anchorage** = 15 (reported anchorage). NOTE: the encoding of **Anchorage Area** with attribute **category of anchorage** = 15 (reported anchorage) of type surface is prohibited.

- If it is required to encode an anchorage which may be used for a period of not more than 24 hours, it must be done using **category of anchorage** = 9 (anchorage for periods up to 24 hours).
- If it is required to encode an anchorage with a specific, limited time period, it must be done using **category of anchorage** = 10 (anchorage for limited period of time). The specific limit of time should be encoded using the complex attribute **information** (see clause 2.4.6), sub-attribute **text** (for example *Anchorage limited to 12 hours*).
- Areas with numerous small craft moorings may be encoded using the feature **Mooring Area** (see clause 16.4). For the encoding of mooring buoys, see clause 20.8.
- For additional guidance regarding the encoding of vessel speed limits, see clause 17.4.

- Areas where anchoring is prohibited must be encoded, where required, as **Restricted Area** (see clause 17.8) with attribute **restriction** = 1 (anchoring prohibited).

Distinction: Anchor Berth; Mooring Area.

#### Inland specific Encoding Instructions:

- For **Anchor Berth** see 16.5
- If there is a time schedule referring to special dates or times, use Time Schedule – In General (tisdge) (see 24.6).
- EUR: The linear extent of **Anchorage Areas** (achare) features is defined by markers or **Notice Marks** (signs E.5 – E.5.15 or E.6) on the bank.
- If the name of the anchorage is important for navigation and should be displayed without the use of the pick report, use **Sea Area** (SEAARE) feature additional.
- If a structured external XML-file with more detailed communication information is available, the reference to the file has to be entered in the **file reference** (TXTDSC) attribute.
- The **class of dangerous goods** in accordance with ADN and the applicable police regulations: 1 (one blue light/cone, signs E.5.5, E.5.9, E.5.13), 2 (two blue lights/cones, signs E.5.6, E.5.10, E.5.14), 3 (three blue lights/cones, signs E.5.7, E.5.11, E.5.15), 4 (no blue lights/cones, signs E.5.4, E.5.8, E.5.12). Dangerous goods in accordance with inland waterway regulations of the Russian Federation: 5 (one red light/cone top down).
- EUR: If the ISRS Location Code is available, it has to be encoded (please refer to 2.4.13). If a maritime MRN or RIS-ID is available, the attribute **interoperability identifier** must be encoded (refer to **Fehler! Verweisquelle konnte nicht gefunden werden.**).
- EUR: **Anchorage Areas** must be encoded.
- EUR: If the authority has extended the application of the prohibition of anchoring to the use of telescopic piles (spuds), **restriction** (RESTRN) =38 (use of spuds prohibited) must be encoded.

<sup>†</sup> Complex attribute **feature name**, sub-attribute **name usage** is mandatory if the name is intended to be displayed when display of names is enabled by the boatmaster. See clause 2.5.8.

For each instance of **fixed date range**, at least one of the sub-attributes **date end** or **date start** must be populated.

For each instance of **information**, at least one of the sub-attributes **file reference** or **text** must be populated.

#### 16.4.1 Mooring area

Where the limits of a mooring area are defined by a regulatory authority (for example harbour authority) they must be shown on the largest optimum display scale IENC data. They may also be shown on other optimum display scale IENC datasets (at smaller scales, if required, using the point primitive) where useful; for example, for planning purposes.

If it is required to encode a mooring area, it must be done using the feature **Mooring Area**.

#### Remarks:

- The complex attribute **feature name**, sub-attribute **name** is used to encode the name and/or number of the **Mooring Area**.
- The complex attribute **information** (see clause 2.4.6) may be used to provide additional information about the category of anchorage, where required.
- For the encoding of mooring buoys, see clause 20.8. For encoding installation buoys used for loading or unloading tankers, see clause 20.7.

Distinction: Anchorage Area; Anchor Berth; Mooring Buoy; Mooring Trot.

**Inland specific Encoding Instructions:**

- A) For **Anchor Berth** see 16.5
- B) If there is a time schedule referring to special dates or times, use **Time Schedule – In General** feature(tisdge) (see 24.6).
- C) If the name of the **Mooring Area** is important for navigation and should be displayed without the use of the pick report, use **Sea Area** (SEAARE) feature additional.
- D) If a structured external XML-file with more detailed communication information is available, the reference to the file has to be entered in the **file reference** (TXTDSC) attribute.
- E) The **class of dangerous cargo** in accordance with ADN and the applicable police regulations: 1 (one blue light/cone, signs E.5.5, E.5.9, E.5.13), 2 (two blue lights/cones, signs E.5.6, E.5.10, E.5.14), 3 (three blue lights/cones, signs E.5.7, E.5.11, E.5.15), 4 (no blue lights/cones, signs E.5.4, E.5.8, E.5.12). Dangerous goods in accordance with inland waterway regulations of the Russian Federation: 5 (one red light/cone top down).
- F) EUR: If the ISRS Location Code is available, it has to be encoded (please refer to 2.4.13). If a maritime MRN or RIS-ID is available, the attribute **interoperability identifier** must be encoded (refer to **Fehler! Verweisquelle konnte nicht gefunden werden.**).
- G) EUR: **Mooring Areas** must be encoded.

## 16.5 Anchor berth

**IHO Definition: ANCHOR BERTH.** A designated area of water where a vessel, seaplane, etc. may anchor. (IHO Dictionary – S-32).

For IENCs a designated area of water where a single vessel, convoy, sea plane, etc. may anchor.

### **S-401 Geo Feature: Anchor Berth (achbrt) (C)**

#### **Primitives: Point, Surface**

† Complex attribute **feature name**, sub-attribute **name usage** is mandatory if the name is intended to be displayed when display of names is enabled by the boatmaster. See clause 2.5.8.

For each instance of **fixed date range**, at least one of the sub-attributes **date end** or **date start** must be populated.

For each instance of **information**, at least one of the sub-attributes **file reference** or **text** must be populated.

#### 16.5.1 Anchor berths

Where the positions or limits of anchorages, including anchor berths, are defined by a regulatory authority (for example harbour authority) they must be shown on the largest optimum display scale IENC data. They may also be shown on other optimum display scale data where useful, for example, for planning purposes.

If it is required to encode an anchor berth, it must be done using the feature **Anchor Berth**.

#### Remarks:

- The complex attribute **feature name**, sub-attribute **name** is used to encode the name and/or number of the **Anchor Berth**. If a group of anchor berths is known by a single common name, the name

should be encoded using a **Sea Area/Named Water Area** feature (see clause 9.1) covering the area of the anchor berths.

- The complex attribute **information** (see clause 2.4.6) may be used to provide additional information about the category of anchorage, where required.
- If an anchor berth is defined by a centre point and a swinging circle, it should be of type point, with the radius of the swinging circle encoded using the attribute **radius**.

Distinction: Anchorage Area; Berth; Mooring Area.

#### Inland specific Encoding Instructions:

- Where an anchor berth may only be used for a limited period the duration should be indicated in **information** (INFORM). If there is a time schedule referring to special dates or times, use **Time Schedule – In General** (tisdge) (see 24.6).
- If the width of an **Anchor Berth** (achbrt) is not defined by **Notice Marks**, it should be 110' / 33,55 m (approximately three barge widths).
- If a structured external XML-file with more detailed communication information is available, the reference to the file has to be entered in the **file reference** (TXTDSC) attribute.
- EUR: The linear extent of an **Anchor Berth** (achbrt) feature is defined by markers or **Notice Marks** (signs E.5 – E.5.15 or E.6) on the bank.
- The class of dangerous goods in accordance with ADN and the applicable police regulations: 1 (one blue light/cone, signs E.5.5, E.5.9, E.5.13), 2 (two blue lights/cones, signs E.5.6, E.5.10, E.5.14), 3 (three blue lights/cones, signs E.5.7, E.5.11, E.5.15), 4 (no blue lights/cones, signs E.5.4, E.5.8, E.5.12). Dangerous goods in accordance with inland waterway regulations of the Russian Federation: 5 (one red light / cone top down).
- EUR: If the ISRS Location Code is available, it has to be encoded (refer to 2.4.13). If a maritime MRN or RIS-ID is available, the attribute **interoperability identifier** must be encoded (refer to **Fehler! Verweisquelle konnte nicht gefunden werden.**).
- EUR: **Anchor Berths** must be encoded.
- EUR: If the authority has extended the application of the prohibition of anchoring to the use of telescopic piles (spuds), **restriction** (RESTRN) =38 (use of spuds prohibited) must be encoded.

† Complex attribute **feature name**, sub-attribute **name usage** is mandatory if the name is intended to be displayed when display of names is enabled by the boatmaster. See clause 2.5.8.

For each instance of **information**, at least one of the sub-attributes **file reference** or **text** must be populated.

### 16.6.1 Seaplane landing areas

If it is required to encode a seaplane landing area, it must be done using the feature **Seaplane Landing Area**.

#### Remarks:

- For additional guidance regarding the encoding of vessel speed limits, see clause 17.4.
- If it is required to encode an area where seaplanes draw water for fire fighting activities, this must be done using **Seaplane Landing Area**.
- If it is required to encode an anchorage for seaplanes, it must be done using an **Anchorage Area** feature (see clause 16.3), with attribute **category of anchorage** = 6 (seaplane anchorage).

Distinction: Airport/Airfield; Helipad; Runway.

#### Inland specific Encoding Instructions:

---

## 16.7 Dumping ground

**IHO Definition:** **DUMPING GROUND.** A sea area where dredged material or other potentially more harmful material, for example explosives, chemical waste, is deliberately deposited. (S-57 Edition 3.1, Appendix A – Chapter 1, Page 1.59, November 2000).

### **S-401 Geo Feature: Dumping Ground (DMPGRD) (C)**

† Complex attribute **feature name**, sub-attribute **name usage** is mandatory if the name is intended to be displayed when display of names is enabled by the boatmaster. See clause 2.5.8.

For each instance of **information**, at least one of the sub-attributes **file reference** or **text** must be populated.

#### 16.7.1 Dumping grounds

Materials deliberately dumped at sea in specified areas (other than those associated with reclamation works) may be classified, according to their significance to the boatmaster, as follows:

- Materials which are generally dispersed before reaching the seabed, for example sewage sludge, are of little navigational significance and no charting action is usually required.
- Spoil from dredging operations or other works which might reduce charted depths significantly in the designated spoil ground.
- Harmful materials, including explosives and chemicals, which are likely to remain concentrated on the seabed.

Dumping of harmful materials is unlikely to affect depths substantially and such dumping grounds are encoded primarily as a warning against anchoring, trawling or other submarine operations.

If it is required to encode a dumping ground, it must be done using the feature **Dumping Ground**.

#### Remarks:

- A **Dumping Ground** feature of type surface must be covered by features from Skin of the Earth as appropriate (**Depth Area** or **Unsurveyed Area**).
- Disused dumping grounds for harmful materials are considered dangerous for an indefinite period and must therefore be encoded on the largest optimum display scale IENC datasets, with attribute

**status** = 4 (not in use). The date when the area ceased to be used may be populated using the attribute **date disused**, if known.

- For additional guidance regarding the encoding of vessel speed limits, see clause 17.4.

### 16.7.2 Spoil grounds, dredging areas

Spoil grounds are areas set aside, clear of shipping channels and in deep water where possible, for the disposal of material (spoil) generally obtained by dredging. Their significance to the boatmaster is that very large quantities of material may be dumped, decreasing the depth of water available. Where possible, charts should be updated in a timely manner so as to include the latest survey information covering the spoil ground.

Extraction (or dredging) areas are those areas where a concentration of dredging vessels may be encountered, taking up sand or shingle to be brought ashore (for example for construction purposes). Their significance is primarily as a collision hazard, although they also indicate the likelihood of finding a greater depth of water than charted. Channels dredged to provide an adequate depth of water for navigation are “dredged areas”, not to be confused with “dredging areas”.

If it is required to encode a spoil ground, it must be done using a **Dumping Ground** feature, with attribute **category of dumping ground** = 5 (spoil ground).

If it is required to encode a dredging area where dredging takes place, it must be done using a **Restricted Area** feature (see clause 17.8), with attribute **category of restricted area** = 21 (dredging area). An area in which seabed material (for example sand, shingle) is being extracted for purposes such as construction must be encoded, where required, using the feature **Offshore Production Area** (see clause 14.6), with attribute **category of production area** = 13 (seabed material extraction area).

#### Remarks:

- Within a spoil ground; if the depths within the area are liable to be very much less than charted after the discharge of spoil and post-dumping surveys are not available, they may be treated as unsurveyed areas (see clause 11.8), in which case soundings and depth contours may be omitted from the area. Alternatively, an indication of the discrepancy between charted depth information and the actual depths within the spoil ground may be provided by downgrading the information included in the underlying **Quality of Bathymetric Data** feature (see clause 3.8).

Distinction: Dredged Area.

#### Inland specific Encoding Instructions:

- A) Use **restriction** (RESTRN) if any of the conditions apply.
- B) Dumping grounds in navigable waters shall be encoded if any one of the listed restrictions applies.

## 16.8 Military practice area

**IHO Definition:** **MILITARY PRACTICE AREA.** An area within which naval, military or aerial exercises are carried out. (Adapted from IHO Dictionary – S-32).

† Complex attribute **feature name**, sub-attribute **name usage** is mandatory if the name is intended to be displayed when display of names is enabled by the boatmaster. See clause 2.5.8.

For each instance of **fixed date range**, at least one of the sub-attributes **date end** or **date start** must be populated.

For each instance of **information**, at least one of the sub-attributes **file reference** or **text** must be populated.

### 16.8.1 Military practice areas

Military practice (or exercise) areas at sea are of various types and may be classified as follows with regard to their significance for the boatmaster:

- Firing danger areas, sometimes called firing practice areas; that is, permanent or temporary ranges, including bombing, torpedo and missile ranges.
- Mine-laying practice (and counter-measures) areas.
- Submarine exercise areas.
- Other exercise areas.

Some degree of restriction on navigation and other rights may be implied by the encoding of military practice areas. There may be varying interpretations of the validity of the restrictions and possible infringement of the rights of innocent passage through territorial waters and elsewhere. Where it is thought desirable to depict such areas, even though clear range procedure may be observed, or the areas appear to be a derogation of the freedom of the seas, boatmasters should be informed (not necessarily on IENCs) that publication of the details of a law or regulation is solely for the safety and convenience of shipping and implies no recognition of the international validity of the law or regulation. By this means infringements are not condoned but the boatmaster receives a warning which may be necessary for their safety.

If it is required to encode a military practice area, it must be done using the feature **Military Practice Area**.

#### Remarks:

- For additional guidance regarding the encoding of vessel speed limits, see clause 17.4.
- Submarine exercise areas should generally not be encoded where submarines exercise over wide areas which it would not be practicable to depict, and over which cautions (to keep a good look out for them) are unlikely to be effective. They may, however, be encoded where they occur in or near major shipping lanes or port approaches.
- Firing danger areas at sea are frequently marked by IALA special buoys sometimes laid around the perimeter of the area and/or by specially erected lights, beacons and targets. If required, all such features which could assist the boatmaster in identifying their position, or could be a hazard, must be encoded in the normal way,
- The existence of mine laying (and counter-measures/clearance) practice areas implies the possibility of unexploded mines or depth charges on the seafloor, and also the presence of harmless practice mines.

Distinction: Caution Area; Restricted Area.

#### Inland specific Encoding Instructions:

---

## 16.9 Administration area

**IHO Definition: ADMINISTRATION AREA.** A defined area within which a jurisdiction applies. It may or may not be named.

For IENCs a defined and named administrative area (e.g. country, state, district) or a defined and named administrative area of a river surveillance

### **S-401 Geo Feature: Administration Area (ADMARE) (O)**

#### **Primitives: Curve, Surface**

<sup>†</sup> Complex attribute **feature name**, sub-attribute **name usage** is mandatory if the name is intended to be displayed when display of names is enabled by the boatmaster. See clause 2.5.8.

For each instance of **information**, at least one of the sub-attributes **file reference** or **text** must be populated.

**16.9.1 International and national territories**

International maritime boundaries are those which have been established by agreement between adjacent or opposite States. Boundaries are sometimes negotiated on the basis of the equidistance or “median” line principle. For various reasons, however, agreed boundaries even when negotiated on this principle are seldom true median lines.

Navigationally, international boundaries may vary in their significance over different parts of their lengths.

Inshore, they may represent the delimitation of Territorial Seas of two states or “internal waters”, (for example within bay closing lines or straight baseline systems). Offshore, they may represent Exclusive Economic Zone and/or Continental Shelf boundaries.

If it is required to encode a named international or national territory, it must be done using the feature **Administration Area**.

Remarks:

- International land boundaries should be encoded, at least in the vicinity of coasts.
- **Administration Area** must only be encoded using the geometric primitive curve where the real-world instance is actually linear, and it is therefore not possible to encode the feature using the geometric primitive surface. See clause 16.2.

Distinction: Fishery Zone; Land Region; Vessel Traffic Service Area.

Inland specific Encoding Instructions:

- A Use **Administration Area** (ADMARE) feature, if the information about the applicable jurisdiction or the competent river surveillance is important for navigation.
- B) The nationality is encoded by a 2 character-code following ISO 3166 (Refer to Annex A to S-57 Appendix A)
- C) If a structured external XML-file with detailed communication information is available, the reference to the file has to be entered in **file reference** (TXTDSC). Otherwise communication information can be provided in **information** (INFORM).

## 16.10 Cargo transhipment area

**IHO Definition:** **CARGO TRANSHIPMENT AREA.** An area designated for the transfer of cargo from one vessel to another sometimes in order to reduce a vessel's draught. (IHO Dictionary – S-32).

**S-401 Geo Feature:** Cargo Transhipment Area (CTSARE) (O)

**Primitives:** Point, Surface

† Complex attribute **feature name**, sub-attribute **name usage** is mandatory if the name is intended to be displayed when display of names is enabled by the boatmaster. See clause 2.5.8.

For each instance of **fixed date range**, at least one of the sub-attributes **date end** or **date start** must be populated.

For each instance of **information**, at least one of the sub-attributes **file reference** or **text** must be populated.

#### 16.10.1 Cargo transshipment areas

Areas generally outside port limits may be specifically designated as suitable for the transshipment of oil or other materials from large ships to smaller vessels. The areas selected are relatively sheltered locations and lie off main shipping routes. As the purpose of transshipment is usually to reduce the draught of the larger vessel to allow it to proceed to port, the operation is often known as “lightening” and the areas may be known as “lightening areas” or “cargo transfer areas”.

If it is required to encode a cargo transshipment area, it must be done using the feature **Cargo Transshipment Area**.

##### Remarks:

- For additional guidance regarding the encoding of vessel speed limits, see clause 17.4.
- The encoding of cargo transshipment areas should be adequate to warn other vessels of the likelihood of encountering ships restricted in their ability to manoeuvre. Regulations governing the use of such areas should be encoded using the attribute **restriction** or the complex attribute **information** (see clause 2.4.6).

Distinction: Dock Area; Harbour Area (Administrative); Harbour Facility.

##### Inland specific Encoding Instructions:

- The feature **Cargo Transshipment Area** (CTSARE) should only be used to distinguish transshipment anchorage areas and anchorage berths from anchorage areas and anchorage berths without transshipment. For berths see 8.14.
- When encoding a transshipment anchorage area or anchorage berth also the **Anchorage Area** (see 16.3) or **Anchor Berth** (see 16.5) must be encoded.
- The feature can be used for all types of cargo transshipment areas used for transshipments between maritime vessels or inland vessels (barges) with or without propulsion.

## 16.11 Caution area

**IHO Definition: CAUTION AREA.** Generally, an area where the mariner has to be made aware of circumstances influencing the safety of navigation. (S-57 Edition 3.1, Appendix A – Chapter 1, Page 1.33, November 2000).

### **S-401 Geo Feature: Caution Area (CTNARE) (C)**

† For each instance of **fixed date range**, at least one of the sub-attributes **date end** or **date start** must be populated.

At least one of the attributes **information** or **pictorial representation** must be populated.

For each instance of **information**, at least one of the sub-attributes **file reference** or **text** must be populated.

Complex attribute **feature name**, sub-attribute **name usage** is mandatory if the name is intended to be displayed when display of names is enabled by the boatmaster. See clause 2.5.8.

#### 16.11.1 Caution areas

If it is required to identify an area in which the boatmaster must be aware of circumstances influencing the safety of navigation (for example an area of continually changing depths), and which cannot be encoded using other feature types, it must be done using the feature **Caution Area**. This feature may be required to identify a danger, a risk, a rule or advice that is not directly related to a particular feature.

##### Remarks:

- If the information applies to a specific area the **Caution Area** feature should cover only that area.
- If the information to be encoded is spatially linear, this should be encoded using a “very narrow” **Caution Area** feature of type surface (approximately 0,3 mm wide at the optimum display scale of the IENC data).
- Information which may be of use to the boatmaster, but is not significant to safe navigation and cannot be encoded using other feature types, should be encoded using an **Information Area** feature (see clause 16.12). This encoding is intended to reduce the number of alarms or indications generated in the Inland ECDIS or ECS due to the overuse of **Caution Area** features.
- Notes should be kept to a minimum and be as concise as is compatible with accuracy and intelligibility. Hydrographic terminology (jargon) should be avoided, giving preference to easily understood words, for example “depths” rather than “bathymetry”.
- In order to ensure correct Inland ECDIS or ECS display, **Caution Area** features of type surface should not share the geometry of features such as **Depth Contour** and other features with higher Inland ECDIS or ECS display priorities (that is, higher than display priority 3), as the **Caution Area** will appear to be “open ended”, which may confuse the boatmaster. Where this occurs, the edge of the **Caution Area** should be extended outward to clear the “shared” edge, sufficient to avoid “duplicate geometry” validation errors (that is, at least 0.3mm at the optimum display scale for the IENC data).

Distinction: Collision Regulations Limit; Information Area; Obstruction; Underwater/Awash Rock; Unsurveyed Area; Wreck.

**Inland specific Encoding Instructions:**

- A To be used on a limited basis only for short sections and in case of real importance for safety of navigation.
- B) Areas signposted by notice marks (areas for water scooters, high speed motorboats and slipping of boats) the feature **Caution Area** (CTNARE) shall also be used. Refer to the list of notice marks in the annex.
- C) Names of the sections shall be those, that are generally known by the boatmasters. In case no specific name is known the name of the closest town or land region should be used.
- D) A short description of the impact on the boatmaster should be provided in **information text** (INFORM).
- E) Cliff/natural rock wall:
  - i US: Use **Caution Area** (CTNARE) to buffer between waterline into depth area. **Caution Area** (CTNARE) should be a minimum of 12 m wide.
  - ii) US: Encode **Caution Area** (CTNARE) **information text** (INFORM) = Natural Rock Wall
  - iii) EUR: If a rock wall is in navigable water and is a hazard to navigation, a **Caution Area** (CTNARE) shall be added.
- F) Swing bridge: US & EUR: Add a **Caution Area** (CTNARE) feature (**information text** (INFORM) = Swing Area) around the swing area that is showing the actual swing area of the swinging bridge span.
- G) Submarine cable: US: Create **Caution Area** (CTNARE) feature buffering the cable 20 metres upstream and downstream of the cable.
- H) Submarine pipelines:
  - i)) US: Create **Caution Area** (CTNARE) feature buffering the pipeline 20 metres upstream and downstream of the pipeline
  - ii) US: For water intakes, place point **Pipeline Submarine/On Land** (PIPSOL) feature near intake location if actual pipe (line) location is unknown. Place 20 metre diameter **Caution Area** (CTNARE) around **Pipeline Submarine/On Land** (PIPSOL) (P).
- I) EUR: Water skiing areas marked by main European inland waterway marking system MAIN EUROPEAN INLAND WATERWAY MARKING SYSTEM signs E.17, where navigation is allowed, should be encoded as **Caution Area** (CTNARE), like areas for water bikes or sail boards.

## 16.12 Information area

**IHO Definition: INFORMATION AREA.** An area for which general information regarding navigation, but not directly related to safety of navigation, is available.

### **S-401 Geo Feature: Information Area (M\_NPUB) (O)**

### Feature Associations

| S-401 Role            | Association Type                                | Associated to               | Type        | Multiplicity |
|-----------------------|-------------------------------------------------|-----------------------------|-------------|--------------|
| The Updated Object    | <b>Updated Information</b> (see clause 25.16)   | <b>Update Information</b>   | Association | 0,*          |
| The Position Provider | <b>Text Association</b> (see clause 25.13).     | <b>Text Placement</b>       | Composition | 0,1          |
| -                     | <b>Additional Information</b> (see clause 25.1) | <b>Nautical Information</b> | Association | 0,*          |
| -                     | <b>Spatial Association</b> (see clause 25.10)   | <b>Spatial Quality</b>      | Association | 0,*          |

† Complex attribute **feature name**, sub-attribute **name usage** is mandatory if the name is intended to be displayed when display of names is enabled by the boatmaster. See clause 2.5.8.

For each instance of **fixed date range**, at least one of the sub-attributes **date end** or **date start** must be populated.

At least one of the attributes **information** or **pictorial representation** must be populated.

For each instance of **information**, at least one of the sub-attributes **file reference** or **text** must be populated.

#### 16.12.1 Information areas

If it is required to encode information which may be of use to the boatmaster, but is not significant to safety of navigation and cannot be encoded using existing features, it must be done using the feature **Information Area**.

##### Remarks:

- The feature **Information Area** encodes information which the producer determines is relevant to the boatmaster, but does not warrant the triggering of Inland ECDIS or ECS alarms through the encoding of **Caution Area** features.
- If the information applies to a specific area the **Information Area** feature should cover only that area.

Distinction: Caution Area; Collision Regulations Limit; Obstruction; Underwater/Awash Rock; Unsurveyed Area; Wreck.

##### Inland specific Encoding Instructions:

---

### 16.13 Custom zone

**IHO Definition:** **CUSTOM ZONE.** The area within which national custom regulations are in force. (S-57 Edition 3.1, Appendix A – Chapter 1, Page 1.46, November 2000).

#### **S-401 Geo Feature: Custom Zone (CUSZNE) (O)**

##### **Primitives: Surface**

| -                  | <b>Spatial Association</b> (see clause 25.10)   | <b>Spatial Quality</b>      | Association | 0,*          |

<sup>†</sup> For each instance of **information**, at least one of the sub-attributes **file reference** or **text** must be populated.

Complex attribute **feature name**, sub-attribute **name usage** is mandatory if the name is intended to be displayed when display of names is enabled by the boatmaster. See clause 2.5.8.

#### 16.13.1 Custom Zones

If it is required to encode a custom zone, it must be done using the feature **Custom Zone**.

Custom zones, where details are provided by a regulatory authority, should be encoded on the largest optimum display scale IENC data covering the area.

#### Remarks:

- No remarks.

Distinction: Checkpoint; Free Port Area.

#### Inland specific Encoding Instructions:

† Complex attribute **feature name**, sub-attribute **name usage** is mandatory if the name is intended to be displayed when display of names is enabled by the boatmaster. See clause 2.5.8.

For each instance of **information**, at least one of the sub-attributes **file reference** or **text** must be populated.

#### 16.14.1 Fishery zones

A fishery zone is an area inside and beyond the Territorial Sea where a coastal State proclaims that it alone may regulate fishing. Where States have permitted others to fish in parts of the area, it may be desirable to encode the area of both the full area and the area of special concessionary rights. In some instances, claims are described as “conservation zones”; for practical purposes these may be classed with fishery zones since their intended function is to institute fishery conservation measures. Most of the fishery zone claims are limited by fixed distance (200 nautical miles in some cases) from the Territorial Sea baselines.

If it is required to encode a fishery zone, it must be done using the feature **Fishery Zone**.

Remarks:

- An indication of the fishery zone limit (for example 6 mile, 12 mile) may be encoded using the complex attribute **feature name**.

Distinction: Administration Area; Restricted Area.

Inland specific Encoding Instructions:

---

## 16.15 Free port area

**IHO Definition: FREE PORT AREA.** A port where certain import and export duties are waived (unless goods pass into the country) to facilitate reshipment to other countries. (IHO Dictionary – S-32).

### **S-401 Geo Feature: Free Port Area (FRPARE) (O)**

### Feature Associations

| S-401 Role            | Association Type                                | Associated to               | Type        | Multiplicity |
|-----------------------|-------------------------------------------------|-----------------------------|-------------|--------------|
| The Updated Object    | <b>Updated Information</b> (see clause 25.16)   | <b>Update Information</b>   | Association | 0,*          |
| The Position Provider | <b>Text Association</b> (see clause 25.13).     | <b>Text Placement</b>       | Composition | 0,1          |
| -                     | <b>Additional Information</b> (see clause 25.1) | <b>Nautical Information</b> | Association | 0,*          |
| -                     | <b>Spatial Association</b> (see clause 25.10)   | <b>Spatial Quality</b>      | Association | 0,*          |

† Complex attribute **feature name**, sub-attribute **name usage** is mandatory if the name is intended to be displayed when display of names is enabled by the boatmaster. See clause 2.5.8.

For each instance of **information**, at least one of the sub-attributes **file reference** or **text** must be populated.

#### 16.15.1 Free port areas

If it is required to encode a free port area, it must be done using the feature **Free Port Area**.

Remarks:

- No remarks.

Distinction: Custom Zone; Production/Storage Area.

Inland specific Encoding Instructions:

- A If a structured external XML-file with more detailed communication information is available, the reference to the file has to be entered in the **file reference** (TXTDSC) attribute.

## 16.16 Harbour area (administrative)

**IHO Definition: HARBOUR AREA.** The area over which a harbour authority has jurisdiction. (S-57 Edition 3.1, Appendix A – Chapter 1, Page 1.80, November 2000).  
For IENCs the area of water and land with the works necessary for its formation, protection and maintenance.

### **S-401 Geo Feature: Harbour Area (Administrative) (hrbare) (C)**

#### **Primitives: Surface**

| -                     | <b>Additional Information</b> (see clause 25.1) | <b>Contact Details, Nautical Information</b> | Association | 0,*          |
| -                     | <b>Spatial Association</b> (see clause 25.10)   | <b>Spatial Quality</b>                       | Association | 0,*          |

† Complex attribute **feature name**, sub-attribute **name usage** is mandatory if the name is intended to be displayed when display of names is enabled by the boatmaster. See clause 2.5.8.

For each instance of **information**, at least one of the sub-attributes **file reference** or **text** must be populated.

### 16.16.1 Administrative harbour areas

Administrative harbour areas must be shown on at least the largest optimum display scale IENC datasets, where possible, to assist boatmasters in complying with harbour regulations.

If it is required to encode an administrative harbour area, it must be done using the feature **Harbour Area (Administrative)**.

#### Remarks:

- If it is required to encode a named harbour area over which there is no jurisdictional authority, it must be done using the feature **Sea Area/Named Water Area** (see clause 9.1).
- A masked line may be used to suppress the symbolisation of the boundary, where such symbolisation is considered inappropriate.

Distinction: Dock Area; Sea Area/Named Water Area.

#### Inland specific Encoding Instructions:

- A **Harbour Area** covers the harbour but also the area of land which supplies the harbour installations.
- If a structured external XML-file with more detailed communication information is available, the reference to the file has to be entered in the **file reference** (TXTDSC) attribute.
- If the ISRS Location Code is available it has to be encoded (refer to 2.4.13). If a maritime MRN or RIS-ID is available, the attribute **interoperability identifier** must be encoded (refer to **Fehler! Verweisquelle konnte nicht gefunden werden.**).

- D) For yacht harbour / marina, see 22.7  
E) EUR: **Harbour Areas** must be encoded.

hrbare Harbour Area (this page)

hrbbsn Harbour Basin (see 8.25)

prtare Port Area (see 8.27)

## 16.17 Oil barrier

**IHO Definition: OIL BARRIER.** A floating barrier to stop and contain the spread of oil on a water body surface. (Defence Geospatial Information Working Group; Feature Data Dictionary Register, 2010). For IENCs any construction to dam oil flow on water.

### **S-401 Geo Feature: Oil Barrier (OILBAR) (M)**

#### **Primitives: Curve**

## 16.18 Straight Territorial Sea Baseline

| <b>IHO Definition: STRAIGHT TERRITORIAL SEA BASELINE.</b> Straight baselines are a system of straight lines joining specified or discrete points on the low-water line, usually known as straight baseline turning points. Straight baselines are used in delimitation. (IHO Dictionary – S-32). |                           |                                                                                                                                                                                                                                                                             |        |              |

† For each instance of **information**, at least one of the sub-attributes **file reference** or **text** must be populated.

Complex attribute **feature name**, sub-attribute **name usage** is mandatory if the name is intended to be displayed when display of names is enabled by the boatmaster. See clause 2.5.8.

### 16.18.1 Straight Territorial Sea Baselines

A Territorial Sea is delimited by:

- Straight Territorial Sea Baselines;
- International maritime boundaries (see clause 16.1); and

The term “Baseline” refers to the line from which the breadth of the Territorial Sea, are measured. It is also the dividing line between internal waters and territorial seas. Internal waters comprise all areas of the sea on the landward side of the Territorial Sea Baselines, as well as inland waters including rivers, lakes, etc.

The normal baseline is the low water line (which is not defined any more precisely by UNCLOS) of the mainland, islands, or low tide elevations, as depicted on large scale charts officially recognised by the coastal State; they therefore do not require depiction in ENC's. Features which are naturally-formed and dry at low water (for example rocks, reefs, sand banks) may be considered low-tide elevations and included in the baseline (details are given in UNCLOS - see IHO publication C-51).

A straight baseline may be used:

- as a closing line across the mouth or estuary of a river;
- as a closing line across the mouth of a juridical bay or a historical bay;
- as part of a system of Straight Territorial Sea Baselines, for example to connect seaward points on a deeply indented coastline, a coastline that is fringed with islands, around unstable coastlines; or
- as an archipelagic baseline.

If it is required to encode a Straight Territorial Sea Baseline, it must be done using the feature **Straight Territorial Sea Baseline**.

Remarks:

- No remarks.

Distinction:Inland specific Encoding Instructions:

---

## 16.19 Pilotage district

**IHO Definition: PILOTAGE DISTRICT.** An area within which a pilotage direction exists. Such directions are regulated by a competent harbour authority which dictates circumstances under which they apply. (UK Pilotage Act 1987).

### **S-401 Geo Feature: Pilotage District (M)**

#### **Primitives: Surface**

| -                     | <b>Spatial Association</b> (see clause 25.10)          | <b>Spatial Quality</b>                       | Association | 0,*          |

† Complex attribute **feature name**, sub-attribute **name usage** is mandatory if the name is intended to be displayed when display of names is enabled by the boatmaster. See clause 2.5.8.

For each instance of **information**, at least one of the sub-attributes **file reference** or **text** must be populated.

#### 16.19.1 Pilotage districts

If it is required to encode the area within which regulations regarding pilotage apply it should be done using the feature **Pilotage District**.

#### Remarks:

- The relevant regulations, where required, must be encoded using the complex attribute **information** (see clause 2.4.6).
- Where the limit of pilotage regulations are coincident with harbour or port limits it is not required to encode a **Pilotage District** feature.
- Each VHF-channel should be indicated, using the attribute **communication channel** (see clause 27.107). Alternately, if the same VHF-channel(s) apply to multiple features in the dataset, this should

be indicated through an associated instance of the information type **Contact Details**, attribute **communication channel** (see clause 24.1).

- The relationship between the pilotage district and any associated pilot boarding places should be encoded using the feature association **Pilotage District Association** (see clause 25.8).

Distinction: Pilot Boarding Place.

Inland specific Encoding Instructions:

---

## 16.20 Collision regulations limit

**IHO Definition:** **COLLISION REGULATIONS LIMIT.** Convention on the International Regulations for Preventing Collisions at Sea, 1972 (COLREGs). The demarcation line between inland navigation rules and international navigation rules.

### **S-401 Geo Feature:** Collision Regulations Limit (O)

#### **Primitives:** Curve

| -                     | <b>Spatial Association</b> (see clause 25.10)   | <b>Spatial Quality</b>      | Association | 0,*          |

† Complex attribute **feature name**, sub-attribute **name usage** is mandatory if the name is intended to be displayed when display of names is enabled by the boatmaster. See clause 2.5.8.

For each instance of **fixed date range**, at least one of the sub-attributes **date end** or **date start** must be populated.

For each instance of **information**, at least one of the sub-attributes **file reference** or **text** must be populated.

#### 16.20.1 Collision regulations limit

If it is required to encode a collision regulations (COLREGs) demarcation line, it must be done using the feature **Collision Regulations Limit**.

##### Remarks:

- If it is required to encode the national regulation citation it must be done using the attribute **regulation citation**. The regulation citation is generally the national legal citation for the implementation of an international regulation (for example 33 *CFR* 26), as distinct from the title for the regulation, which should be populated in the complex attribute **feature name**, sub-attribute **name** (for example *International Regulations for the Prevention of Collisions at Sea – Vessel Bridge-to-Bridge Radiotelephone Regulations*).

Distinction: Administration Area.

##### Inland specific Encoding Instructions:

† Complex attribute **feature name**, sub-attribute **name usage** is mandatory if the name is intended to be displayed when display of names is enabled by the boatmaster. See clause 2.5.8.

Inland specific encoding instructions:

- A) The actual value for ship dimension limits are encoded by the respective regulation attributes (**maximal permitted beam** (lg\_bme), **maximal permitted length** (lg\_lgs), **maximal permitted draught** (lg\_drt), **maximal permitted water displacement** (lg\_wdp)).
- B) If **maximal permitted water displacement** (lg\_wdp) is encoded the unit for the water displacement must be given as well.
- C) Use **related issue** (lg\_rel) to indicate if the particular regulation is meant to control the general usage of the waterway, the carriage of equipment, tasks/operations performed by the boatmaster or other instructions.
- D) Condition attributes (**category of ship (including)** (lc\_csi); **category of ship (excluding)** (lc\_cse); **assemblies of ship (including)** (lc\_asi); **assemblies of ship (excluding)** (lc\_ase); **category of cargo (including)** (lc\_cci); **category of cargo (excluding)** (lc\_cce)) must be used to describe the conditions under which a particular law / regulation is applicable.
- E) To describe the categories for ship types, ship formations and cargo type use either implicit or explicit type selection.
- F) If the value 2 'other' is used for one of the above category attributes the description attribute **related issue** (lg\_des) must be used to describe the details or indicate where detailed information can be found.
- G) EUR: Must be encoded if a regulation for (a stretch of) a waterway with regard to maximum permitted ship dimensions exists unless a CEMT class has been encoded by a **Waterway Area** (wtware) feature (15.23 CEMT Classification) and the permitted ship dimensions are equal to the CEMT class.

## 16.22 Maximum Permitted Vessel Speed

IHO Definition: Waterway or waterway section for which a juridical regulation with respect to the maximum permitted vessel speed exists.

### **S-401 Geo Feature: Maximum Permitted Vessel Speed (lg\_vsp) (C)**

**Super Type:**

**Primitives:** surface

## 17 Geo Features – Restricted Areas – Overview

There are many types of areas within which certain activities are discouraged or prohibited, or from which certain classes of vessels are excluded. The general term for all areas in which certain aspects of navigation may be restricted or prohibited by regulations is “Restricted Area”, or equivalent. The word “prohibited”, or its equivalent, may appear in terms relating to activities which are contrary to the regulations, for example “Anchoring Prohibited”, “Entry Prohibited”.

If it is required to encode a restricted area, it must be done using the feature **Restricted Area** (see clause 17.8); or using other features having the attribute **restriction** (**Anchorage Area**, **Cable Area**, **Cargo Transshipment Area**, **Dumping Ground**, **Dredged Area**, **Fairway**, **Harbour Facility**, **Inshore Traffic Zone**, **Marine Farm/Culture**, **Military Practice Area**, **Offshore Production Area**, **Submarine Pipeline Area**, **Pipeline Submarine/On Land**, **Precautionary Area**, **Seaplane Landing Area**, **Traffic Separation Scheme Crossing**, **Traffic Separation Scheme Lane Part**).

### Remarks:

- The attribute **category of restricted area** is used to describe the reason for the regulation, while the attribute **restriction** describes the restrictions.
- The complex attribute **information** (see clause 2.4.6) may be used to provide an additional explanation about the regulation (for example the equivalent to a caution note from a paper chart), where required.
- An area in which regulations apply due to recreation activities such as water skiing, jet skiing, kite surfing and rowing must be encoded, where required, as **Restricted Area** with **category of restricted area** = 32 (recreation area).
- If it is required to encode an area for which the boatmaster must be made aware of circumstances influencing the safety of navigation, it must be done using the feature **Caution Area** (see clause 16.11). This feature may be used to identify a danger, a risk, a rule or advice (for example an area of continually changing depths) which is not directly related to a particular feature.

### 17.1 Minefields

If it is required to encode a minefield, it must be done using a **Restricted Area** feature (see clause 17.8), with attribute **category of restricted area** = 14 (minefield). Former mined areas should also be encoded with attribute **status** = 4 (not in use).

### 17.2 Degaussing ranges

A degaussing (or demagnetising) range is an area, usually of about 0.2 M diameter, within which ships' magnetic fields may be measured. Sensing instruments and cables are installed on the seafloor in the range and there are cables leading from the range to a control position ashore. The range is usually marked by distinctive buoys. The significance of a degaussing range to boatmasters is that anchoring and trawling are prohibited and that the range may have to be avoided when vessels are using it.

If it is required to encode a degaussing range, it must be done using a **Restricted Area** feature (see clause 17.8), with attribute **category of restricted area** = 8 (degaussing range).

### 17.3 Nature reserves

If it is required to encode a marine nature reserve area, it must be done using a **Restricted Area** feature (see clause 17.8), with attribute **category of restricted area** = 4 (nature reserve).

### 17.4 Speed limits

Speed is often limited inside harbours in order to prevent wakes. If it is required to encode this restriction, it must be done using a **Restricted Area** feature (see clause 17.8), with the attribute **category of restricted area** = 24 (no wake area) or **restriction** = 13 (no wake). If it is required to encode cases where the speed limit is known in general or for a certain class(es) of vessel, it must be done using a **Restricted Area** or using other features having the attribute **restriction** (see clause 17 above) and having **restriction** = 27 (speed restricted), with the speed limit, speed units and, if appropriate, the class of vessel, encoded using an instance of the complex attribute **vessel speed limit**, subattributes **speed limit**, **speed units** and **vessel class**. Further detailed information regarding speed limits, for example varying speed limits based on vessel length, draught or cargo, may be encoded, if required, using the complex attribute **information**; or using the attribute **pictorial representation** (for example, to reproduce the graphic for a speed restriction table contained in a Nautical Publication).

If it is required to encode the buoys/beacons marking the **Restricted Area** feature with speed limits, it must be done using **Special Purpose/General Beacon** or **Special Purpose/General Buoy** features (see clauses 20.13 and 20.5 respectively), with the attribute **category of special purpose mark** = 24 (reduced wake mark) or 25 (speed limit mark). The speed limit and its unit of measurement should be encoded using the complex attribute **information** (see clause 2.4.6), sub-attribute **text** (for example *Speed limit is 6 knots*).

### 17.5 Anchoring restricted

If it is required to encode a restricted anchoring area, it must be done using a **Restricted Area** feature (see clause 17.8), or using other features with the attribute **restriction** (see clause 17.17), where **restriction** = 1 (anchoring prohibited) or 2 (anchoring restricted). Additional information about the restriction should be encoded using the complex attribute **information** (see clause 2.4.6).

### 17.6 Areas to be avoided

If it is required to encode an IMO Area to be Avoided, it must be done using a **Restricted Area** feature (see clause 17.8), with attribute **restriction** = 14 (area to be avoided). An IMO Area to be Avoided around a navigational aid must also be encoded with attribute **category of restricted area** = 12 (navigational aid safety zone).

#### Remarks:

- Areas other than IMO Area to be Avoided for which entry is prohibited or restricted should be encoded using the **Restricted Area**, having values **restriction** = 7 (entry prohibited) or 8 (entry restricted).

## 17.7 Environmentally Sensitive Sea Areas

Environmentally Sensitive Sea Areas (ESSA) should be included on IENCs where there is a specifically identified requirement, and where it is practicable, given the optimum display scale of the IENC data and the extent of the ESSA. If there is no such requirement, or if it is not practicable, details of ESSA should only be inserted in associated publications, such as Sailing Directions. It should be noted that the inclusion of ESSA on smaller optimum display scale of the IENC data may be appropriate for voyage planning purposes.

If it is required to encode an Environmentally Sensitive Sea Area, it must be done using a **Restricted Area** feature (see clause 17.8), with attribute **category of restricted area** = 27 (ESSA) or 28 (PSSA).

An Environmentally Sensitive Sea Area that is shown on the source as a point symbol should be encoded using a small surface restricted area feature.

## 17.8 Restricted area

**IHO Definition: RESTRICTED AREA.** A specified area on land or water designated by an appropriate authority within which access or navigation is restricted in accordance with certain specified conditions. (Adapted from IHO Dictionary – S-32).

For IENCs restricted areas typically surround dams; see 8.12 **Dams**.

† Complex attribute **feature name**, sub-attribute **name usage** is mandatory if the name is intended to be displayed when display of names is enabled by the boatmaster. See clause 2.5.8.

For each instance of **fixed date range**, at least one of the sub-attributes **date end** or **date start** must be populated.

For each instance of **information**, at least one of the sub-attributes **file reference** or **text** must be populated.

### 17.8.1 Restricted areas

If it is required to encode a restricted area, it must be done using the feature **Restricted Area**, or using other features having the attribute **restriction** (**Anchorage Area**, **Cable Area**, **Dumping Ground**, **Dredged Area**, **Fairway**, **Harbour Facility**, **Inshore Traffic Zone**, **Marine Farm/Culture**, **Military Practice Area**, **Offshore Production Area**, **Submarine Pipeline Area**, **Pipeline Submarine/On Land**, **Precautionary Area**, **Seaplane Landing Area**, **Traffic Separation Scheme Crossing**, **Traffic Separation Scheme Lane Part**).

#### Remarks:

- If the type of restriction for the area cannot be encoded using the mandatory attribute **restriction** it must be encoded, where required, using the complex attribute **information**, sub-attribute **text**; and **restriction** populated as empty (null).
- For additional guidance regarding the encoding of vessel speed limits, see clause 17.4.
- The term “no anchoring area” is used to identify the IMO routeing measure of that name. Such areas, where required, must be encoded as **Restricted Area** with attribute **restriction** = 1 (anchoring prohibited).

Distinction: Anchorage Area; Cable Area; Caution Area; Collision Regulations Limit; Depth Area; Dredged Area; Dumping Ground; Fairway; Information Area; Military Practice Area; Submarine Pipeline Area.

#### Inland specific Encoding Instructions:

- Outline restricted area. The shoreline can be part of it, but may not be overlapped.
- EUR: Restricted areas that are or could be defined by the signs A.1 to A.9, B.6, C.1, C.3, C.5 (see annex AA) shall be encoded.
- If a restriction is more complicated see 16.21 and 16.22.

- D) The feature should not be used for restrictions that apply to whole waterways or large sections of waterways. For instance, If one restricted area covers a waterway, smaller restricted areas with more important information for the safety of navigation may not be noticed by the user. Especially restricted fairway depth and restricted fairway width should only be used for small areas of up to 1 km.
- E) EUR: **category of restricted area** (CATREA) = 26 (waterskiing area) may only be used, if navigation is not allowed in the area. Water skiing areas marked by signs E.17, where navigation is allowed, should be encoded as **Caution Area** (CTNARE), like areas for water bikes or sail boards.
- F) EUR: If the authority has extended the application of the prohibition of anchoring to the use of telescopic piles (spuds), **restriction** (RESTRN) =38 (use of spuds prohibited) must be encoded.
- G) Where anchoring or using spuds is prohibited, encode **Restricted Area** (RESARE, resare) for sections of a revetment within the waterway.
- H) If appropriate, place **Restricted Area** (RESARE, resare) around dam, extending on both sides of the dam the length of the lock guidewall or the area that is marked by buoys.
- I) Sections of limited depth are generally, short sections of a waterway with limited depth and well known to boatmasters as of high relevance for safety, also by shipping companies as the reference for the planning of the draught of vessels.
  - i) To be used on a limited basis only for short sections.
  - ii) Names of the sections shall be those, which are generally known by the boatmasters. In case no specific name is known the name of the closest town or land region should be used.
  - iii) If it is not sure that the bottom of the river is stable, **information text** (INFORM) shall equal, "water depth may change rapidly".
- J) Sections of limited width are generally, short sections of a waterway with limited width and well known to boatmasters.
  - i) To be used on a limited basis only for short sections.
  - ii) Names of the sections shall be those, which are generally known by the boatmasters. In case no specific name is known the name of the closest town or land region should be used.

## 18 Geo Features – Aids to Navigation – Overview

In the context of this Product Specification, the following generic term definitions apply:

**Beacon:** A fixed artificial navigation mark that can be recognised by its shape, colour, pattern, topmark or light character, or a combination of these. It may carry various additional aids to navigation. This term is not commonly used when the navigation mark can be classified as a lighthouse. (IHO Dictionary - S-32).

**Buoy:** A floating object moored to the bottom in a particular (charted) place, as an aid to navigation or for other specific purposes. Navigational buoys may be classified according to: (a) their shape, appearance, or construction, such as barrel, can, cask, conical, cylindrical, dan, keg, nun, pillar, spar, spherical, or topmark buoy; (b) their colour, such as black, chequered, green, red buoy; (c) their location, such as bifurcation, fairway, junction, mid-channel, middle-ground, or turning buoy; (d) the various kinds of hazards or dangers to navigation which they mark, such as bar, isolated danger, fish trap, obstruction, spoil ground, telegraph or wreck buoy; (e) their particular purpose or use, such as anchor, anchorage, compass adjustment, dredging, farewell (or landfall), marker, quarantine, station (or watch), or warping buoy. (IHO Dictionary - S-32).

### 18.1 Geo features forming parts of navigational aids

Aids to navigation are composed of fixed or floating structure features established specifically as an aid to navigation, which may carry equipment features.

When identifying relationships (associations) between aids to navigation and associated geo features within this document, three “base classes” are used to define the aids to navigation geo features included in the relevant association. These “base classes” are:

- Structure Features: Includes **Cardinal Beacon, Cardinal Buoy, Daymark, Emergency Wreck Marking Buoy, Installation Buoy, Isolated Danger Beacon, Isolated Danger Buoy, Lateral Beacon, Lateral Buoy, Landmark, Pile, Safe Water Beacon, Safe Water Buoy, Special Purpose/General Beacon, Special Purpose/General Buoy.**
- Equipment Features: Includes **Daymark, Fog Signal, Helipad** (exceptionally, see 2<sup>nd</sup> Remarks bullet below), **Light Air Obstruction, Light All Around, Light Sector, Physical AIS Aid to Navigation, Radar Reflector, Radar Transponder Beacon, Signal Station Traffic, Signal Station Warning.**
- Navigational Aid Features: Includes **Cardinal Beacon, Cardinal Buoy, Daymark, Emergency Wreck Marking Buoy, Installation Buoy, Isolated Danger Beacon, Isolated Danger Buoy, Lateral Beacon, Lateral Buoy, Pile, Safe Water Beacon, Safe Water Buoy, Special Purpose/General Beacon, Special Purpose/General Buoy.**

The encoding of relationships between structure and equipment features is described in clause 18.2.

Remarks: Exceptionally,

- Structures that have not been established specifically as an aid to navigation may also carry aids to navigation as equipment features. These include **Bridge, Building, Cable Overhead, Conveyor, Crane, Dolphin, Floating Dock, Fortified Structure, Fishing Facility, Hulk, Landmark, Offshore Platform, Pipeline Overhead, Pontoon, Pylon/Bridge Support, Obstruction, Shoreline Construction, Silo/Tank, Span Fixed, Span Opening, Wind Turbine, Wreck.** If it is required to encode such supporting structures at the same location as an equipment feature, it must be encoded as a separate feature, and share the same spatial type as (for point structures), or cover the location of (for structures of type curve or area) the equipment feature.

- Substantive structures, which may carry helipads, erected in the water and intended to perform the function of light support must be encoded, where required, using the feature **Landmark** (see clauses 7.2 and 25.12). Exceptionally, **Helipad** features may also, if required, be associated to **Building**, **Landmark** or **Offshore Platform** features that do not additionally perform the function of a support for an aid to navigation, using the feature association **Structure/Equipment** (see clause 18.2).
- Topmarks are encoded as part of the navigational aid structure, using the complex attribute **topmark** (see clause 29.37).
- Radar reflectors must not be encoded as separate features when attached to navigational aids. If it is required to encode their existence, it must be done by populating the Boolean attribute **radar conspicuous** = *True*. Radar reflectors may only be encoded where their position is known and they are included as equipment features on an overhead cable structure feature (see clauses 6.10.1, 20.15.1 and 25.12).
- Rescue stations and coast guard stations are not related to navigation, and they must not, therefore, be part of the equipment features of navigational aids. If it is required to encode a rescue or coast guard station at the same location as a navigational mark, it must be encoded as a separate feature, and share the same spatial type as the navigational aid.

## 18.2 Relationships

A **Structure/Equipment** feature association (see clause 25.12) must be created in order to relate the different features comprising a navigational aid. Where a **Structure/Equipment** feature association is created, there must be only one structure feature related to one or more equipment features. An equipment feature must not be related to more than one structure feature.

**Figure 18-1 – Navigational aids – Structure/equipment association**

Note that **Daymark** may be a structure feature or an equipment feature (refer to the lists of structure and equipment features at clause 18.1); where a navigational aid contains a **Daymark** and there is no other base structure (which can serve as the structure feature) indicated on the source, the **Daymark** feature should be encoded as the structure feature. A single **Daymark** feature instance must not be both a structure and an equipment feature.

When the nature of the base structure on land is unknown or there is no structure feature, one of the equipment features may be chosen as the structure feature, giving priority to a **Light All Around** or **Light Sected** feature, if one exists (however, see also clause 19.1.8). Where this

occurs, the light feature must be encoded as the structure feature in the **Structure/Equipment** relationship. Alternatively, a **Pile** feature of type point or a **Special Purpose/General Beacon** feature may be encoded as the structure feature at the same position as the equipment features. When a light is located in the water with no indication on the source of the structure feature, regardless of the height of the light, a **Pile** feature of type surface or a **Special Purpose/General Beacon** feature should be encoded as the structure feature. This will ensure that a symbol will be shown on Inland ECDIS or ECS systems when the light features are not displayed during daytime navigation.

*Figure 18-2 – Navigational aids – Structure/equipment feature associations: Real-world examples*

In the above real-world examples, the structure and equipment features that make up the navigational aids are point spatial types, and they must share the same geographic point spatial type.

If it is required to encode the name of the navigational aid, it must be done using the complex attribute **feature name** (see clause 2.5.8) on the structure feature. The name must not be repeated for the equipment features. If the name is painted on the structure, it must be encoded with the same spelling in the complex attribute **feature name**. If the name is not based on the Latin alphabet, it must be encoded using **feature name (name)**, with an appropriate value populated for the sub-attribute **language**, and transliterated for encoding on an iteration of **feature name (name)** with an appropriate value populated for the mandatory attribute **language** (normally English (*eng*)).

All point features comprising a navigational aid must share the same geographic point spatial instance.

#### Remarks:

- For guidance related to the population of the temporal attributes **date end** and **date start** for equipment features in a **Structure/Equipment** association relationship, see clause 2.4.9.

### 18.3 Buoyage systems and direction of buoyage

Systems of buoyage are described as lateral, cardinal, or a combination of lateral and cardinal. Lateral systems depend on a direction of buoyage being defined. The cardinal system depends solely on the main points of the compass. Special purpose buoys often mark the limits or centre

of an area (for example an exercise area, a dumping ground) and do not necessarily have lateral or cardinal system characteristics.

The IALA Maritime Buoyage System details, including the extent of Regions A and B, are given in other publications (for example UK's booklet NP 735 "IALA Maritime Buoyage System"). Although it is called a buoyage system, it applies to all fixed and floating marks except lighthouses, some sector lights, leading lights and marks, major floating lights and lights on offshore structures. Six types of marks are provided by the system: Lateral, Cardinal, Isolated danger, Safe water, Special and Emergency Wreck Marking marks, which may be used in any combination.

### 18.3.1 Buoyage systems and direction of buoyage

The buoyage system of the area covered by the dataset and, where necessary, the direction of buoyage, must be encoded using the Meta features **Navigational System of Marks** and **Local Direction of Buoyage**:

All parts of the dataset containing data must be covered by **Navigational System of Marks** features (see clause 3.6), with the mandatory attribute **marks navigational – system of** indicating the buoyage system in operation. **Navigational System of Marks** features must not overlap.

Within a dataset, there may be some areas where the direction of buoyage is defined by local rules and must, therefore, be specified. These areas should be encoded as separate **Local Direction of Buoyage** features (see clause 3.7), with the mandatory attribute **orientation value** indicating the direction of buoyage. **Local Direction of Buoyage** features must not overlap, but in areas where local buoyage directions apply, **Local Direction of Buoyage** features must overlap **Navigational System of Marks** features (see Figure 18-3 below).

Figure 18-3 – Buoyage system and direction

Individual buoys and beacons may not be part of the general buoyage system. This should be encoded using the attribute **marks navigational – system of** on these buoy and beacon features.

#### 18.3.1.1 Encoding IALA marks within IALA A or B

In the following Tables the symbol '/' indicates that this attribute is not relevant for that particular feature class. The Tables contain the most common examples of encoding; other encoding combinations are possible. For encoding of buoys, substitute **Buoy** for **Beacon** in the Feature column. Table 18-3 for topmarks refers to the sub-attribute values for the complex attribute **topmark**.

| Real World Feature                            | Feature                | category of cardinal mark | colour | colour pattern | marks navigational – system of |
|-----------------------------------------------|------------------------|---------------------------|--------|----------------|--------------------------------|
| North cardinal beacon                         | <b>Cardinal Beacon</b> | 1                         | 2,6    | 1              | 1 and 2 (IALA A and B)         |
| East cardinal beacon                          | <b>Cardinal Beacon</b> | 2                         | 2,6,2  | 1              | 1 and 2 (IALA A and B)         |
| South cardinal beacon                         | <b>Cardinal Beacon</b> | 3                         | 6,2    | 1              | 1 and 2 (IALA A and B)         |
| West cardinal beacon                          | <b>Cardinal Beacon</b> | 4                         | 6,2,6  | 1              | 1 and 2 (IALA A and B)         |
| Port lateral beacon                           | <b>Lateral Beacon</b>  | 1                         | 3      | /              | 1 (IALA A)                     |
| Starboard lateral beacon                      | <b>Lateral Beacon</b>  | 2                         | 4      | /              | 1 (IALA A)                     |
| Preferred channel to starboard lateral beacon | <b>Lateral Beacon</b>  | 3                         | 3,4,3  | 1              | 1 (IALA A)                     |
| Preferred channel to port lateral beacon      | <b>Lateral Beacon</b>  | 4                         | 4,3,4  | 1              | 1 (IALA A)                     |
| Port lateral beacon                           | <b>Lateral Beacon</b>  | 1                         | 4      | /              | 2 (IALA B)                     |
| Starboard lateral beacon                      | <b>Lateral Beacon</b>  | 2                         | 3      | /              | 2 (IALA B)                     |
| Preferred channel to starboard lateral beacon | <b>Lateral Beacon</b>  | 3                         | 4,3,4  | 1              | 2 (IALA B)                     |
| Preferred channel to port lateral beacon      | <b>Lateral Beacon</b>  | 4                         | 3,4,3  | 1              | 2 (IALA B)                     |

**Table 18-1 – IALA cardinal and lateral marks – Attribute encoding**

| Real World Feature           | Feature                               | colour     | colour pattern | marks navigational – system of |
|------------------------------|---------------------------------------|------------|----------------|--------------------------------|
| Emergency wreck marking buoy | <b>Emergency Wreck Marking Buoy</b>   | 5,6 or 6,5 | 2              | 1 and 2 (IALA A and B)         |
| Isolated danger beacon       | <b>Isolated Danger Beacon</b>         | 2,3,2      | 1              | 1 and 2 (IALA A and B)         |
| Safe water beacon            | <b>Safe Water Beacon</b>              | 3,1 or 1,3 | 2              | 1 and 2 (IALA A and B)         |
| Special purpose beacon       | <b>Special Purpose/General Beacon</b> | 6          | /              | 1 and 2 (IALA A and B)         |

**Table 18-2 – IALA emergency wreck marking, isolated danger, safe water and special purpose/general marks – Attribute encoding**

| Real World Feature                 | Feature                                       | topmark /<br>daymark<br>shape | colour* | colour<br>pattern* | marks navigational<br>– system of |
|------------------------------------|-----------------------------------------------|-------------------------------|---------|--------------------|-----------------------------------|
| North cardinal topmark             | <b>Cardinal<br/>Beacon</b>                    | 13                            | 2       | /                  | 1 and 2<br>(IALA A and B)         |
| East cardinal topmark              | <b>Cardinal<br/>Beacon</b>                    | 11                            | 2       | /                  | 1 and 2<br>(IALA A and B)         |
| South cardinal topmark             | <b>Cardinal<br/>Beacon</b>                    | 14                            | 2       | /                  | 1 and 2<br>(IALA A and B)         |
| West cardinal topmark              | <b>Cardinal<br/>Beacon</b>                    | 10                            | 2       | /                  | 1 and 2<br>(IALA A and B)         |
| Isolated danger topmark            | <b>Isolated Danger<br/>Beacon</b>             | 4                             | 2       | /                  | 1 and 2<br>(IALA A and B)         |
| Port lateral topmark               | <b>Lateral Beacon</b>                         | 5                             | 3       | /                  | 1 (IALA A)                        |
| Starboard lateral topmark          | <b>Lateral Beacon</b>                         | 1                             | 4       | /                  | 1 (IALA A)                        |
| Port lateral topmark               | <b>Lateral Beacon</b>                         | 5                             | 4       | /                  | 2 (IALA B)                        |
| Starboard lateral topmark          | <b>Lateral Beacon</b>                         | 1                             | 3       | /                  | 2 (IALA B)                        |
| Safe water topmark                 | <b>Safe Water<br/>Beacon</b>                  | 3                             | 3       | /                  | 1 and 2<br>(IALA A and B)         |
| Special purpose topmark            | <b>Special<br/>Purpose/General<br/>Beacon</b> | 7                             | 6       | /                  | 1 and 2<br>(IALA A and B)         |
| Emergency wreck marking<br>topmark | <b>Emergency<br/>Wreck<br/>Marking Buoy</b>   | 8                             | 6       | /                  | 1 or 2 (IALA<br>A or B)           |

**Table 18-3 – IALA topmarks – Attribute encoding**

\* If it is required to encode an aid to navigation that may be considered to be a topmark but has multiple colours that are considered important for navigation, this should be done using the feature **Daymark** (see clause 20.14).

## 19 Geo Features – Lights

For the purpose of encoding lights in IENC, the following features must be used, depending on the type of light:

- **Light All Around** (see clause 19.2) for lights having the same character over the whole horizon of interest to marine navigation (all-round lights)), excluding fog detector and air obstruction lights;
- **Light Sected** (see clause 19.3) for lights having one or more sectors which have different characteristics, including directional lights and lights having obscured or partially obscured sectors; and
- **Light Air Obstruction** (see clause 19.4) for lights marking an obstacle which constitutes a danger to air navigation.

When encoding a light, the combination of the character and purpose of the light must be evaluated in order to determine the most appropriate light feature from the above list.

### 19.1 Lights: General

#### 19.1.1 Rhythms of lights

The principal character of a light is its rhythm (although, strictly, fixed lights and some alternating lights are not “rhythmic”).

If it is required to encode the rhythms of lights, this must be done using the complex attribute **rhythm of light**, sub-attributes **light characteristic** and **signal group**. When populating **rhythm of light**, the sub-attributes **signal group**, **signal period** and **signal sequence** are only valid for non-fixed lights (that is, sub-attribute **light characteristic** ≠ 1 (fixed)), with **signal group** and **signal period** being mandatory.

The use of these sub-attributes is defined in the following Table; it contains the most common examples of coding; other coding combinations are possible:

| Rhythms of lights           | F                 | Oc  | Oc(2) | Oc(2+3) | Iso | FI  | FI(3) | LFI |
|-----------------------------|-------------------|-----|-------|---------|-----|-----|-------|-----|
| <b>light characteristic</b> | 1                 | 8   | 8     | 8       | 7   | 2   | 2     | 3   |
| <b>signal group</b>         | <i>prohibited</i> | (1) | (2)   | (2+3)   | (1) | (1) | (3)   | (1) |

| Rhythms of lights           | Q   | Q(3) | VQ  | VQ(3) | UQ  | IUQ |
|-----------------------------|-----|------|-----|-------|-----|-----|
| <b>light characteristic</b> | 4   | 4    | 5   | 5     | 6   | 11  |
| <b>signal group</b>         | (1) | (3)  | (1) | (3)   | (1) | ( ) |

| Rhythms of lights           | Mo(K) | FFI   | Q(6)+LFI | VQ(6)+LFI | Al.WR | Al.FI.WR | Al.FI(2W+1R) | Al.Oc(4)WR |
|-----------------------------|-------|-------|----------|-----------|-------|----------|--------------|------------|
| <b>light characteristic</b> | 12    | 13    | 25       | 26        | 28    | 19       | 19           | 17         |
| <b>signal group</b>         | (K)   | ()(1) | (6)(1)   | (6)(1)    | ( )   | (1)      | (2+1)        | (4)        |

*Table 19-1 – Rhythms of lights – Common encoding examples*

#### 19.1.2 Types and functions of lights

If it is required to encode types and functions of lights, this must be done using the attribute **category of light** (see clause 27.55).

#### 19.1.3 Elevations of lights

The elevation of a light is the vertical distance between the light source and the plane of reference for heights for the IENC data (see clause 2.5.7).

If it is required to encode the elevation of a light on a fixed structure, it must be done using the attribute **height**.

If it is required to encode the height above the water surface of a light on a floating structure, it must be done using the attribute **vertical length** on the relevant light feature (see clause 2.5.7).

#### 19.1.4 Times of exhibition and exhibition conditions

##### 19.1.4.1 Night lights

If it is required to encode a night light, it must be done using the attribute **exhibition condition of light** = 4 (night light) on the light feature.

##### 19.1.4.2 Unwatched lights

This information should not be encoded, but unwatched (unmanned) lights, with no standby or emergency arrangements, may be encoded using attribute **status** = 17 (unwatched).

##### 19.1.4.3 Occasional lights

If it is required to encode an occasional light, it must be done using attribute **status** = 2 (occasional). If it is required to encode a private light that is not regularly exhibited, it must be done using **status** = 2,8 (occasional, private).

##### 19.1.4.4 Daytime lights

If it is required to encode a light shown throughout 24 hours without change of character, it must be done using attribute **exhibition condition of light** = 1 (light shown without change of character).

If it is required to encode a light having characteristics shown by day different from those shown at night, it must be done by encoding two light features sharing the same point spatial instance:

- one light feature with **exhibition condition of light** = 2 (daytime light),
- one light feature with **exhibition condition of light** = 4 (night light).

##### 19.1.4.5 Fog lights

If it is required to encode a light which is exhibited in fog or conditions of reduced visibility, it must be done using a light feature, with attributes **exhibition condition of light** = 3 (fog light) and **status** = 2 (occasional).

If it is required to encode a light having characteristics shown in fog that are different from those shown in conditions of normal visibility, it must be done by encoding two light features sharing the same point spatial instance:

- one light feature with **exhibition condition of light** = 3 (fog light) and **status** = 2 (occasional)
- one light feature with **exhibition condition of light** = 2 (daytime light) or 4 (night light) and the complex attribute **information** (see clause 2.4.6), sub-attribute **text** = *Character of the light changes in fog*.

##### 19.1.4.6 Manually-activated lights

If a light is radio activated, the attribute **signal generation** must be populated with value 5 (radio activated). To encode the contact information for activation of the light, it must be done using the information type **Contact Details** (see clause 24.1). The **Contact Details** must be associated to the light feature using the association **Additional Information**.

If a light is activated by calling into a manned station, the attribute **signal generation** must be populated with value 6 (call activated). To encode the contact information for the manned station, it must be done using the information type **Contact Details**. The **Contact Details** must be associated to the light feature using the association **Additional Information**.

#### 19.1.5 Leading lights

If it is required to encode a leading light, it must be done using an appropriate light feature, with attribute:

**category of light** =     4,12 - front leading light  
                                   4,13 - rear leading light  
                                   4,14 - lower leading light  
                                   4,15 - upper leading light

Remarks:

- Even if, on the source, the leading lights are merged into a single symbol, a light feature must be created for each light. These lights must be placed in their true position; that is, where the source shows a single light with a legend such as *2F.Bu*, further investigation must be done in order to determine the true position of each light, and its full attribution. Compilers should note that where this occurs on paper charts, the position of the light shown on the chart normally corresponds with the rear leading light.
- The leading line must be encoded using the method described in clause 15.1.
- 

### 19.1.6 Lighthouses

If it is required to encode a lighthouse, it must be done using a **Landmark** feature (see clause 7.2), with attributes **category of landmark** = 17 (tower) and **function** = 33 (light support) for towers, or using a **Building** feature (see clause 6.2), with the attribute **function** = 33, for any other shapes.

If it is required to encode the attributes **elevation**, **height** and **vertical length** for a lighthouse, this must be done as described in clause 19.1.3.

If the lighthouse is permanently extinguished/unlit, this must be indicated by population of the attribute **status** = 4 (not in use) for the **Landmark/Building**, and the light feature must be removed. Where a lighthouse is illuminated by flood lights, the additional value of **status** = 12 (illuminated) must also be populated. For lights that are temporarily extinguished, see clause 31.2.2 – paragraph 10(i).

### 19.1.7 Various special types of lights

| Type                  | category of light | Remarks                                                                                                                                                                                                                                                                                                                                                                                                             |
|-----------------------|-------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Subsidiary light      | 10                | Encoded as a separate light from the main light feature                                                                                                                                                                                                                                                                                                                                                             |
| Aero light            | 5                 |                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Air obstruction light |                   | Encode using feature <b>Light Air Obstruction</b>                                                                                                                                                                                                                                                                                                                                                                   |
| Bearing light         | 18                |                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Flood light           | 8                 | Only to encode flood lights that are visible from seaward. The illuminated structure should be encoded using appropriate feature classes, with attribute <b>status</b> = 12 (illuminated) and, if the flood lit colour of the structure is considered important for navigation, complex attribute <b>information</b> , sub-attribute <b>text</b> indicating the colour; for example, <i>Purple when flood lit</i> . |
| Synchronized lights   |                   | <b>status</b> =15.                                                                                                                                                                                                                                                                                                                                                                                                  |
| Strip light           | 9                 |                                                                                                                                                                                                                                                                                                                                                                                                                     |

|                              |    |                                                                                                                                                                                                                                                                   |
|------------------------------|----|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Spot light                   | 11 | Only to encode spot lights that are visible from seaward. The illuminated feature should be encoded using appropriate feature classes, with attribute <b>status</b> = 12 (illuminated)                                                                            |
| Emergency light              | 17 | Must be encoded as a separate feature to the main light feature                                                                                                                                                                                                   |
| Horizontally disposed lights | 19 | The number of lights must be encoded using complex attribute <b>multiplicity of features</b>                                                                                                                                                                      |
| Vertically disposed lights   | 20 | The number of lights must be encoded using complex attribute <b>multiplicity of features</b>                                                                                                                                                                      |
| Specific pattern of lights   |    | The pattern must be encoded using complex attribute <b>information</b> , sub-attribute <b>text</b> ; for example <i>lights disposed in the shape of a triangle</i> . The number of lights must be encoded using complex attribute <b>multiplicity of features</b> |

**Table 19-2 – Special types of lights**

### 19.1.8 Light structures

Light features located in the water must have a structure feature, generally a beacon (for example **Lateral Beacon**, **Special Purpose/General Beacon**) or other fixed structure (for example **Offshore Platform**), or a buoy structure (for example **Lateral Buoy**, **Special Purpose/General Buoy**) for floating aids to navigation. When a light is located in the water with no indication on the source of the structure feature, regardless of the height of the light, a **Pile** feature of type surface or a **Special Purpose/General Beacon** feature should be encoded as the structure feature. This will ensure that a symbol will be shown on Inland ECDIS or ECS systems when the light features are not displayed during daytime navigation.

The light portrayal rules for Inland ECDIS or ECS result in the display of **Light All Around** features with Boolean attribute **major light** = *True* using a 360° light sector. On land, if no aid to navigation structure object has been encoded at the position of these lights, the boatmaster does not have a displayed centre point to take bearings to:

**Figure 19-1 – Omnidirectional light display in Inland ECDIS or ECS**

Encoders are advised, therefore, that an aid to navigation structure object (for example **Special Purpose/General Beacon, Pile**) should be encoded as a light structure object for all **Light All Around** features on land encoded as major lights, where the nature of the structure object is unknown.

## 19.2 Light all around

**IHO Definition: ALL AROUND LIGHT.** An all around light is a light that is visible over the whole horizon of interest to marine navigation and having no change in the characteristics of the light.

† For non-fixed lights (that is, sub-attribute **light characteristic** ≠ 1 (fixed)), the sub-attributes **signal group** and **signal period** are mandatory.

Complex attribute **feature name**, sub-attribute **name usage** is mandatory if the name is intended to be displayed when display of names is enabled by the boatmaster. See clause 2.5.8.

For each instance of **fixed date range**, at least one of the sub-attributes **date end** or **date start** must be populated.

For each instance of **information**, at least one of the sub-attributes **file reference** or **text** must be populated.

### 19.2.1 All around lights

If it is required to encode an all around light (excluding fog detector and air obstruction lights), it must be done using the feature **Light All Around**. This feature must be an equipment feature of a structure feature (see clause 18.2), which may be another light feature at the same position (if it exists and there is no structure feature available), using a **Structure/Equipment** feature association.

The IALA Maritime Buoyage System rules do not apply for most landfall lights and will apply to minor lights, but not to leading lights, some sector lights or major floating lights. In general, sector lights follow IALA convention when used for marking a channel.

Further guidance for encoding various types and characteristics of lights can be found in clauses 19.1.1 to 19.1.7.

#### Remarks:

- All sector lights, whether single sectored, multi-sectored or having sectors that are deliberately obscured or completely or partially obscured by obstructions, must be encoded, where required, using the feature **Light Sectored** (see clause 19.3); for encoding a directional sector or bearing, see clause 19.3.1.2.
- Air obstruction lights must be encoded, where required, using the feature **Light Air Obstruction** (see clauses 19.4).
- If it is required to encode details of the lighting technology (for example neon), it must be done using the complex attribute **information** (see clause 2.4.6).
- If it is required to encode the purpose of a spotlight, it must be done using the complex attribute **information**.
- Lights on land encoded as major lights (Boolean attribute **major light** = *True*) must have a structure feature encoded (see clause 19.1.8) in order for the position of the light to be clearly indicated in the Inland ECDIS or ECS.

- The attribute **vertical datum** applies only to **height**; this value must only be encoded if it is different from the value of **vertical datum** encoded on the underlying meta feature **Vertical Datum of Data** (see clause 3.10).
- Value 13 (low water) for attribute **vertical datum** is only applicable to enclosed (inland) waterways; and must not be used to indicate the reference datum for the height of the light in tidal waters.
- The attribute **vertical length** only applies to lights attached to floating structures (see clause 2.5.7).
- The indication that a light is a “major” light through the population of the Boolean attribute **major light** with a *True* value determines the way the light is displayed in Inland ECDIS or ECS, and is not based on any legal or formal classification of the importance of lights. Generally, a major light may be considered to be a light intended for use at sea, usually with a range of 15 miles or more, and in outer approaches to harbours. However the determination of what is a major light may be based on a number of additional factors, including the number and characteristics of navigational (and non-navigational) lights in the geographical area, and specific navigational requirements for the area. Indication in a dataset that a light is a major light should be based only on the requirements for Inland ECDIS or ECS display, at the discretion of the producer.
- Names of major lights are very important. If a light has a name which is unrelated to any other encoded feature, the name must be populated using the complex attribute **feature name** (see clause 2.5.8) on at least the largest optimum display scale IENC data. If the name of a light is obviously that of the named feature on which the light stands, for example Saint Catherine’s Point, the name of the light need not be repeated for the light.

Distinction: Cardinal Beacon; Cardinal Buoy; Emergency Wreck Marking Buoy; Installation Buoy; Isolated Danger Beacon; Isolated Danger Buoy; Lateral Beacon; Lateral Buoy; Light Air Obstruction; Light Sector; Safe Water Beacon; Safe Water Buoy; Special Purpose/General Beacon; Special Purpose/General Buoy.

Inland specific Encoding Instructions:

- A **Feature name** (OBJNAM) should be placed on the supporting structure (structure feature) and not on the **Light All Around** (LIGHTS).
- B) When no specific signal group is provided, use SIGGRP=().
- C) If there are multiple lights in the same position, make one **Light All Around** (LIGHTS) feature and use **multiplicity of features** (MLTYLT) to define the number of lights represented.
- D) US: **status** (STATUS) = 8 (private)
- E) US: Western River Rules, RED will always be a double flash **signal group** (SIGGRP) (2), and Green will always be a single flash.
- F) The light characteristic LITCHR is defined as follows:
  1. fixed: a signal light that shows continuously, in any given direction, with constant luminous intensity and colour
  2. flashing: a rhythmic light in which the total duration of light in a period is clearly shorter than the total duration of darkness, and all the appearances of light are of equal duration
  3. long-flashing: a flashing light in which a single flash of not less than two seconds duration is regularly repeated
  4. quick-flashing: a light exhibiting without interruption very rapid regular alternations of light and darkness
  5. very quick flashing: a flashing light in which flashes are repeated at a rate of not less than 80 flashes per minute but less than 160 flashes per minute
  6. ultra quick flashing: a flashing light in which flashes are repeated at a rate of not less than 160 flashes per minute
  7. isophased: a light with all durations of light and darkness equal
  8. occulting: a rhythmic light in which the total duration of light in a period is clearly longer than the total duration of darkness and all the eclipses are of equal duration

- 9. interrupted quick flashing: a quick light in which the sequence of flashes is interrupted by regularly repeated eclipses of constant and long duration
- 10. interrupted very quick flashing: a light in which the very rapid alterations of light and darkness are interrupted at regular intervals by eclipses of long duration
- 11. interrupted ultra quick flashing: a light in which the ultra quick flashes (160 or more per minute) are interrupted at regular intervals by eclipses of long duration
- 12. morse: a rhythmic light in which appearances of light of two clearly different durations are grouped to represent a character or characters in the Morse code
- 28. alternating: a signal light that shows, in any given direction, two or more colours in a regularly repeated sequence with a regular periodicity

- G) The signal period SIGPER is the time occupied by an entire cycle of intervals of light and eclipse.
- H) The signal group SIGGRP is the number of signals, the combination of signals or the morse character(s) within one period of full sequence. The signal group of a light is encoded using brackets to separate the individual groups. A group of signals may be a single number, a chain of numbers separated by "+", a sequence of up to 4 letters or a letter and a number. A fixed light has no signal group. Where no specific signal group is given for one of the light characteristics, this should be shown by an empty pair of brackets.
- I) The sequence of times occupied by intervals of light and eclipse is encoded in SIGSEQ. Example: "00.8+(02.2)+00.8+(05.2)" encodes a signal sequence with two intervals of light and two intervals of eclipse.
- J) Example of encoding: red night light on a buoy (see illustration): **Light All Around** (LIGHTS) (colour (COLOUR) 3, **exhibition condition of light** (EXCLIT) 4, **light characteristic** (LITCHR) 4, **signal period** (SIGPER) 3.5, **signal group** (SIGGRP) (), **signal sequence** (SIGSEQ) 00.7+(02.8), **status** (STATUS) 14, **scale minimum** (SCAMIN) 22000)

- K) Official aids to navigation shall be encoded.
- L) US: For airport runway lights, encode **category of light** (CATLIT) = 5 (aero light). Encode **exhibition condition of light** (EXCLIT) = 4 (night light) if appropriate
- M) Lights on the towers of overhead pipes should be encoded.
- N) US: descending bank (e.g. LDB for left descending bank, should be encoded in **information** (INFORM).

## 19.3 Light sectored

**IHO Definition: SECTOR LIGHT.** A light presenting different appearances (in particular, different colours) over various parts of the horizon of interest to maritime navigation. (IHO Dictionary – S-32).

<sup>†</sup> For non-fixed lights (that is, sub-attribute **light characteristic** ≠ 1 (fixed)), the sub-attributes **signal group** and **signal period** are mandatory.

For a light sector that is a directional sector, the sub-complex attribute **directional character** is mandatory.

For a light sector that is not a directional sector (that is, sub-complex attribute **directional character** is not populated), the sub-complex attribute **sector limit** is mandatory.

Complex attribute **feature name**, sub-attribute **name usage** is mandatory if the name is intended to be displayed when display of names is enabled by the boatmaster. See clause 2.5.8.

For each instance of **fixed date range**, at least one of the sub-attributes **date end** or **date start** must be populated.

For each instance of **information**, at least one of the sub-attributes **file reference** or **text** must be populated.

### 19.3.1 Sector, lights

If it is required to encode a light that consists of one or more sectors, it must be done using the feature **Light Sector**. This feature must be an equipment feature of a structure feature (see clause 18.1), which may be another light feature at the same position (if it exists and there is no structure feature available), using a **Structure/equipment** feature association.

<sup>2</sup> See clause 18.2.

The IALA Maritime Buoyage System rules do not apply for most landfall lights and will apply to minor lights, but not to leading lights, some sector lights or major floating lights. In general, sector lights follow IALA convention when used for marking a channel.

Further guidance for encoding various types and characteristics of lights can be found in clauses 19.1.1 to 19.1.7.

Remarks:

- The complex attribute **sector characteristics**, sub-complex attribute **light sector** is used to populate each sector for the light, except for sectors in which there is no light exhibited. Where there is a different rhythm of light between sectors (for example, for complex lights), separate instances of **sector characteristics** must be populated.
- Population of the sub-complex attribute **sector limit** having sub-attributes **sector limit one** = 0 and **sector limit two** = 360 (that is, encoding an all around light as a sectored light) is prohibited.
- If a sector of a sectored light is intended to have a directional function, this must be encoded using the **light sector** complex sub-attribute **directional character**. If the light is intensified in this sector, **light sector** subattribute **light visibility** = 4 (intensified) must be populated. The sub-complex attribute **sector limit** is optional for directional light sectors.
- The sub-attribute **sector line length** (see clause 27.220) may be used for critical light sectors to extend the sector line when the Inland ECDIS or ECS display settings are set to display default sector lines. The intended usage of the IENC dataset must be considered when determining the usage of **sector line length** so as to avoid excessive screen clutter when default sector display is enabled; and consistent display of light sectors across the entire IENC portfolio should also be a consideration when determining the population of this attribute. Where populated, the value of **sector line length** must not exceed the value populated for the sub-attribute **value of nominal range** for the light sector.
- In some cases the area defined by the intersecting sectors of two discrete sector lights are used to indicate the existence of isolated and sometimes substantial dangers to navigation, the precise position of which may not be known. When default sectors are displayed in Inland ECDIS or ECS, the extent and intent of these sectors may not be clearly defined to the boatmaster. In order to more clearly indicate these areas, compilers should consider appropriate use of **sector line length** for the relevant sectors in the impacted area. Where it is considered important that the area of possible danger is defined, this should be done by encoding a **Caution Area** feature (see clause 16.11) covering the intersection area. Information relating to the definition of the area by sector lights and a précis of the danger should be encoded using the complex attribute **information** (see clause 2.4.6) for the **Caution Area**.
- The fairway defined by the succession of navigable areas in the white sectors of a series of **Light Sectored** features may be encoded using the feature **Fairway** (see clause 15.5).
- If there is additional information required to be encoded that is relevant to all sectors of the light, this must be done using the **information** (see clause 2.4.6). If the additional information is relevant to individual sectors of the light only (for example, for complex (oscillating) light sectors (see clause 19.3.1.3 below)), this must be encoded using the complex sub-attribute **sector information** for the sub-complex attribute **light sector**.
- If it is required to encode details of the lighting technology (for example neon), it must be done using the complex attribute **information**.
- The attribute **vertical datum** applies only to **height**; this value must only be encoded if it is different from the value of **vertical datum** encoded on the underlying meta feature **Vertical Datum of Data** (see clause 3.10).
- Value 13 (low water) for attribute **vertical datum** is only applicable to enclosed (inland) waterways; and must not be used to indicate the reference datum for the height of the light in tidal waters.
- Names of major lights are very important. If a light has a name which is unrelated to any other encoded feature, the name must be populated using the complex attribute **feature name** (see clause 2.5.8) on at least the largest scale optimum display scale IENC data. If the name of a light is obviously that of the named feature on which the light stands, for example Saint Catherine's Point, the name of the light need not be repeated for the light.

### 19.3.1.1 Lights obscured by obstructions

Figure 19-2 – Obscured light sectors

If an encoded light is obscured in a part of the navigable area of a sector (see Figure 19-2 (A) above) beyond an offshore obstruction, it must be encoded using **Light Sected**, with each of the sectors (a) – (c) encoded using the complex attribute **light sector**. The partially obscured sector of (b) must have **light sector** with subattributes **light visibility** = 8 (partially obscured) and sub-attribute **value of nominal range** set to the distance from the light to the obstruction. The sectors in which the light is visible from seaward ((a) and (c)) must be encoded as separate iterations of **light sector**.

If there is no navigable water between the light and the obstruction (see (e) in Figure 19-2 (B) above), the masked sector must not have an iteration of **light sector** encoded, unless a faint light is visible in the navigable part of the sector, which should be encoded using **light sector**, with sub-attribute **light visibility** = 3 (faint). The sectors in which the light is visible from seaward ((d) and (f)) must be encoded as separate iterations of **sector characteristics**.

### 19.3.1.2 Directional lights

Directional (or direction) lights of several types are in use but all have in common a very narrow sector intended to mark a direction to be followed. The narrow sector may be flanked by:

- Unlit sectors or unintensified light.
- Sectors of different colour or character. Some direction lights are so precise that a complete colour change at a sector boundary occurs over an angle of less than 1 minute ( $0.02^\circ$ ). This corresponds to a lateral distance of just 1 metre at a viewing distance of 3.5 km. In addition the intensity may be maintained right to the edge of the beam, and does not reduce the further the observer is away from the axis.

A moiré effect mark (or variable arrow mark) is a short-range (normally up to 2 km) type of directional “light”. Sodium lighting gives a yellow background to a screen (up to 3 m square) on which a vertical black line will be seen by an observer on the centreline, or variable arrow marks when course alteration is needed. The system can be used by day and night. It can also be used as a stop line (seen abeam) for vessels berthing along quays.

If it is required to encode a light sector having a directional function, it must be done using the feature **Light Sected**.

#### Remarks:

- The indication that a particular light sector has a directional function is encoded by populating the complex attribute **sector characteristics**, sub-complex attribute **directional character**.
- The mandatory complex sub-attribute **orientation** must only be encoded to indicate the orientation, measured from seaward, of the leading line of the directional light sector when there is no

**Recommended Track** or **Navigation Line** feature associated with the directional light. Where the directional sector has an associated **Recommended Track** and/or **Navigation Line**, **orientation (orientation value)** for the light sector must be populated with an empty (null) value.

- For a sector indicated as directional, the **light sector** complex sub-complex attribute **sector limit** is optional.
- For moiré effect lights, the Boolean sub-attribute **moiré effect** must be set to *True*.
- If it is required to encode the recommended track and/or navigation line associated with a directional light, it must be done using the methods described in clause 15.1.

### 19.3.1.3 Oscillating light sectors

Evolving technology in the development of navigational lights has resulted in the installation of complex directional navigation lights with multiple sectors, colours and characteristics, some with oscillating sectors, in many areas where navigation is restricted. These lights may have up to 7 sectors, with the central sector being a very narrow, sometimes intensified, fixed white sector performing the directional function of the light. In the IALA A System, the sectors flanking this directional light may be alternating and oscillate increasingly from white to green (to starboard) and red (to port) with increasing deviation from the track defined by the directional light. These lights will normally be flanked by narrow sectors of fixed green (to starboard) and red (to port). Additionally, there may be outer sectors that are occulting green (to starboard) and red (to port) which oscillate with increasing period of eclipse to isophased or flashing with increasing deviation from the track defined by the directional light. For the IALA B System the colours are reversed. In some cases these complex lights may not conform to IALA. Each of the outer sectors may be very narrow.

If it is required to encode an oscillating light sector, it should be done using a **Light Sector** feature, with iterations of the complex attribute **sector characteristics** as follows:

For light sectors in the IALA A system that are alternating and oscillate increasingly from white to green (to starboard) and red (to port) with increasing deviation from the track defined by the directional light:

**sector characteristics: light characteristic** = 28 (Alternating); **colour** = 1,3 (White, Red); **sector limit; sector information (text)** = *White phase decreases as bearing to light increases*

**sector characteristics: light characteristic** = 28 (Alternating); **colour** = 1,4 (White, Green); **sector limit; sector information (text)** = *White phase increases as bearing to light increases*

For lights in the IALA B system that are alternating and oscillate increasingly from white to red (to starboard) and green (to port) with increasing deviation from the track defined by the directional light; transpose the colours red and green in the above encoding.

For lights in the IALA A system that are occulting green (to starboard) and red (to port) which oscillate with increasing period of eclipse to isophased or flashing with increasing deviation from the track defined by the directional light:

**sector characteristics: light characteristic** = 8 (Occulting); **colour** = 3 (Red); **sector limit; sector information (text)** = *Light phase decreases as bearing to light increases*

**sector characteristics: light characteristic** = 8 (Occulting); **colour** = 4 (Green); **sector limit; sector information (text)** = *Light phase increases as bearing to light increases*

For lights in the IALA B system that are occulting red (to starboard) and green (to port) which oscillate with increasing period of eclipse to isophased or flashing with increasing deviation from the track defined by the directional light; transpose the colours red and green in the above encoding.

Oscillating lights which are not IALA should be encoded similar to the above. For instance, where a light contains white sectors that are occulting and oscillate with increasing period of eclipse to isophased or flashing with increasing deviation from the track defined by the directional light:  
For the sector to port of the track defined by the directional light:

**sector characteristics: light characteristic** = 8 (Occulting); **colour** = 1 (White); **sector limit**; **sector information (text)** = *Light phase decreases as bearing to light increases* For the sector to starboard of the track defined by the directional light:

**sector characteristics: light characteristic** = 8 (Occulting); **colour** = 1 (White); **sector limit**; **sector information (text)** = *Light phase increases as bearing to light increases*

All other light sectors must be encoded using additional iterations of **sector characteristics**, with subattributes (including **light sector** or **directional character**) populated in accordance with the characteristics of the sector.

Distinction: Cardinal Beacon; Cardinal Buoy; Emergency Wreck Marking Buoy; Installation Buoy; Isolated Danger Beacon; Isolated Danger Buoy; Lateral Beacon; Lateral Buoy; Light Air Obstruction; Light All Around; Safe Water Beacon; Safe Water Buoy; Special Purpose/General Beacon; Special Purpose/General Buoy.

#### Inland specific Encoding Instructions:

- A **Sector limit one** (SECTR1) specifies the first limit of the sector. The order of **sector limit one** (SECTR1) and **sector limit two** (SECTR2) is clockwise around the central feature (e.g. a light).
- B) **Feature name** (OBJNAM) should be placed on the supporting structure (structure feature) and not on the **Light Sector** (LIGHTS).
- C) The light characteristic LITCHR is defined as follows:
  1. fixed: a signal light that shows continuously, in any given direction, with constant luminous intensity and colour
  2. flashing: a rhythmic light in which the total duration of light in a period is clearly shorter than the total duration of darkness and all the appearances of light are of equal duration
  3. long-flashing: a flashing light in which a single flash of not less than two seconds duration is regularly repeated
  4. quick-flashing: a light exhibiting without interruption very rapid regular alternations of light and darkness
  5. very quick flashing: a flashing light in which flashes are repeated at a rate of not less than 80 flashes per minute but less than 160 flashes per minute
  6. ultra quick flashing: a flashing light in which flashes are repeated at a rate of not less than 160 flashes per minute
  7. isophased: a light with all durations of light and darkness equal
  8. occulting: a rhythmic light in which the total duration of light in a period is clearly longer than the total duration of darkness and all the eclipses are of equal duration
  9. interrupted quick flashing: a quick light in which the sequence of flashes is interrupted by regularly repeated eclipses of constant and long duration
  10. interrupted very quick flashing: a light in which the very rapid alterations of light and darkness are interrupted at regular intervals by eclipses of long duration
  11. interrupted ultra quick flashing: a light in which the ultra quick flashes (160 or more per minute) are interrupted at regular intervals by eclipses of long duration
  12. morse: a rhythmic light in which appearances of light of two clearly different durations are grouped to represent a character or characters in the Morse code

28. alternating: a signal light that shows, in any given direction, two or more colours in a regularly repeated sequence with a regular periodicity

- D) The signal period SIGPER is the time occupied by an entire cycle of intervals of light and eclipse.
- E) The signal group SIGGRP is the number of signals, the combination of signals or the morse character(s) within one period of full sequence. The signal group of a light is encoded using brackets to separate the individual groups. A group of signals may be a single number, a chain of numbers separated by "+", a sequence of up to 4 letters or a letter and a number. A fixed light has no signal group. Where no specific signal group is given for one of the light characteristics, this should be shown by an empty pair of brackets.
- F) The sequence of times occupied by intervals of light and eclipse is encoded in SIGSEQ. Example: "00.8+(02.2)+00.8+(05.2)" encodes a signal sequence with two intervals of light and two intervals of eclipse.
- G) Official aids to navigation shall be encoded.
- H) US: descending bank (e.g. LDB for left descending bank, should be encoded in **information** (INFORM).

## 19.4 Light air obstruction

**IHO Definition:** **AIR OBSTRUCTION LIGHT.** An air obstruction light is a light marking an obstacle which constitutes a danger to air navigation. (IHO Dictionary – S-32).

† For non-fixed lights (that is, sub-attribute **light characteristic** ≠ 1 (fixed)), the sub-attributes **signal group** and **signal period** are mandatory.

Complex attribute **feature name**, sub-attribute **name usage** is mandatory if the name is intended to be displayed when display of names is enabled by the boatmaster. See clause 2.5.8.

For each instance of **fixed date range**, at least one of the sub-attributes **date end** or **date start** must be populated.

For each instance of **information**, at least one of the sub-attributes **file reference** or **text** must be populated.

#### 19.4.1 Air obstruction lights

If it is required to encode a light marking an obstacle which constitutes a danger to air navigation, which may also be used as a navigational aid, it must be done using the feature **Light Air Obstruction**. This feature must be an equipment feature of a structure feature (see clause 18.1) using a **Structure/Equipment** feature association.

Further guidance for encoding various types and characteristics of lights can be found in clauses 19.1.1 to 19.1.7.

##### Remarks:

- If it is required to encode details of the lighting technology (for example neon), it must be done using the complex attribute **information** (see clause 2.4.6).
- The attribute **vertical datum** applies only to **height**; this value must only be encoded if it is different from the value of **vertical datum** encoded on the underlying Meta feature **Vertical Datum of Data** (see clause 3.10).
- Value 13 (low water) for attribute **vertical datum** is only applicable to enclosed (inland) waterways; and must not be used to indicate the reference datum for the height of the light in tidal waters.

Distinction: Cardinal Beacon; Cardinal Buoy; Emergency Wreck Marking Buoy; Installation Buoy; Isolated Danger Beacon; Isolated Danger Buoy; Lateral Beacon; Lateral Buoy; Light All Around; Light Sector; Safe Water Beacon; Safe Water Buoy; Special Purpose/General Beacon; Special Purpose/General Buoy.

##### Inland specific Encoding Instructions:

---

## 20 Geo Features – Buoys, Beacons, Notice Marks

### 20.1 Lateral buoy

**IHO Definition: LATERAL BUOY.** A lateral buoy is used to indicate the port or starboard hand side of the route to be followed. They are generally used for well-defined channels and are used in conjunction with a conventional direction of buoyage. (UKHO NP 735, 5<sup>th</sup> Edition).

For IENCs this includes

- Buoys at bifurcations of channels (A buoy at a fairway junction may indicate by its top mark on which side it is preferable to pass (main channel)).
- Buoys at bridge pillars (A buoy at a bridge pillar may be used to improve the visibility of the pillar location on the radar.)
- Buoys marking danger points (Buoys to indicate the presence of potentially dangerous obstructions such as groins, banks, or wrecks.)
- Stalling buoys (The buoys (floating beacons) are used to mark stalling current which does not coincide with a direction of the fairway.)
- Swinging lateral buoys (The buoys are used to mark swinging points at the edges of the extended rectilinear fairways, as well as at the fairway edges where the vision is limited.)

#### **S-401 Geo Feature: Lateral Buoy (BOYLAT, boylat) (M)**

<sup>†</sup> The attribute/sub-attribute **colour pattern** is mandatory for buoys/topmarks that have more than one value populated for the attribute/sub-attribute **colour**.

Complex attribute **feature name**, sub-attribute **name usage** is mandatory if the name is intended to be displayed when display of names is enabled by the boatmaster. See clause 2.5.8.

For each instance of **fixed date range**, at least one of the sub-attributes **date end** or **date start** must be populated.

For each instance of **information**, at least one of the sub-attributes **file reference** or **text** must be populated.

### 20.1.1 Lateral buoys

Lateral buoys are generally used for well-defined channels, in conjunction with a direction of buoyage. They indicate the port and starboard sides of the route to be followed.

To conform to the IALA Maritime Buoyage System (see clause 18.3.1.1), port hand buoys are usually can shaped, but may be another shape (except conical or spherical). Other shaped buoys have a can topmark. The colour of port hand buoys, topmarks and lights (if fitted) will be red in IALA region A and green in IALA region B.

To conform to the IALA Maritime Buoyage System, starboard hand buoys are usually conical shaped, but may be another shape (except can or spherical). Other shaped buoys have a conical topmark. The colour of starboard hand buoys, topmarks and lights (if fitted) will be green in IALA region A and red in IALA region B.

A preferred channel mark is a modified lateral mark, with horizontal colour bands. The shape and predominant colour indicates which side is the preferred channel, the other colour indicates the secondary channel. If fitted, the light is Fl(2+1), the colour indicating the preferred channel.

If it is required to encode a buoy having the function of a lateral mark, it must be done using the feature **Lateral Buoy**.

Figure 20-1 – IALA lateral buoys – Characteristics

Remarks:

- If it is required to encode a buoy or topmark that has more than one colour, the attributes colour and colour pattern must be encoded, according to the rules laid out in clause 2.4.10.
- If it is required to encode the total vertical length, including the topmark and any equipment features (for example light), of the buoy above the water level, it must be done using the attribute vertical length.

Distinction: Cardinal Buoy; Emergency Wreck Marking Buoy; Installation Buoy; Isolated Danger Buoy; Mooring Buoy; Safe Water Buoy; Special Purpose/General Buoy.

Inland specific Encoding Instructions:

- A EUR: The designator as it appears on the buoy, if it can be read from a passing vessel, should be encoded in the attribute **feature name** (OBJNAM). Administrative information on the buoys that is not relevant for navigation should be encoded in the attribute **information**. It is not repeated for each equipment feature.
- B) EUR: For buoys with **marks navigational – system of** (MARSYS) = 11 in case the complex attribute **top mark** (TOPMAR) is added:  
**topmark/daymark shape** (TOPSHP) = 5 (cylinder) for right hand side buoys  
**topmark/daymark shape** (TOPSHP) = 1 (cone, point up) for left hand side buoys
- C) EUR: for buoys with **marks navigational – system of** (MARSYS) = 11 **buoy shape** (BOYSHP)/**category of lateral mark** (CATLAM)/**colour** (COLOUR) attributes must be used in the following combinations:  
1 (conical) / 8 (left fairway side) / 4 (green)  
2 (can) / 7 (right fairway side) / 3 (red)
- D) US: **buoy shape** (BOYSHP)/**category of lateral mark** (CATLAM)/**colour** (COLOUR) attributes must be used in the following combinations:  
1 (conical) / 2 (starboard-hand lateral mark) / 3 (red)  
2 (can) / 1 (port-hand lateral mark) / 4 (green)
- E) US: Use **information text** (INFORM) to note the river tender or vessel used to place/set buoy
- F) EUR: If not under the issuing authority, use **information text** (INFORM) to indicate responsibility of operation of the buoy.
- G) If the system of navigational marks of a special sign is different from the system mentioned in the meta feature **Navigational System of Marks** (m\_nsys), or there is no meta feature **Navigational System of Marks** (m\_nsys) feature in the cell, the attribute **marks navigational – system of** (MARSYS) has to be used.
- H) **Lateral Buoy** (BOYLAT, boylat) must act as structure feature to a **Light All Around** (LIGHTS) feature (if it exists).
- I) EUR: In the Po River, a red buoy represents an obstacle near the right bank. The buoy has to be kept on the right when navigating in the downstream direction and has to be kept on the left when navigating in the upstream direction. **Colour** (COLOUR) = [3 (red)]
- J) EUR: In the Po River, a white buoy represents an obstacle near the left bank. The buoy has to be kept on the left when navigating in the downstream direction and has to be kept on the right when navigating in the upstream direction. **Colour** (COLOUR) = [1 (white)]
- K) Buoy at bifurcation of channel  
i) EUR: If a buoy is according to IALA with preference of channel, feature **Lateral Buoy** (BOYLAT), **category of lateral mark** (CATLAM) = 3 or 4 shall be used.  
ii) EUR: Coding of the attribute **category of lateral mark** (CATLAM) is mandatory.  
In case the complex attribute **topmark** (TOPMAR) is added:  
**topmark/daymark shape** (TOPSHP) = 3 (sphere) and **colour** (COLOUR)/**colour pattern** (COLPAT) shall be encoded for the buoy and/or

- topmark/daymark shape** (TOPSHP) = 1 (cone, point up) if **category of lateral mark** (CATLAM) = 3 or **topmark/daymark shape** (TOPSHP) = 5 (cylinder) if **category of lateral mark** (CATLAM) = 4
- If buoy according to IALA with preference of channel, **Lateral Buoy** (BOYLAT), **category of lateral mark** (CATLAM) = 3 or 4
- iii) IALA: If there is no preference to pass **Special Purpose/General Buoy** (BOYSPP) with (M) **category of special purpose mark** (CATSPM) = 54 (channel separation mark) is used
  - iv) EUR: For a buoy with **marks navigational – system of** (MARSYS) = 11 main European inland waterway marking system, feature **Lateral Buoy** (boylat) with **category of lateral mark** (CATLAM) = 3, 4 or 8 shall be used.  
The **colour** (COLOUR) attribute shall be encoded with 3,4,3,4 (red / green)
  - v) EUR: For a buoy with two topmarks, encode only the upper **topmark** (TOPMAR).
- L) Buoy at bridge pillar
- i) This feature must be included in a **Bridge Aggregation** feature.
- M) Buoy marking danger point
- i) EUR: For buoys with **marks navigational – system of** (MARSYS) = 11 feature **Lateral Buoy** (boylat) has to be used.  
**Buoy shape** (BOYSHP)/**category of lateral mark** (CATLAM)/**colour** (COLOUR) attributes must be used in the following combinations:  
5 (spar) / 16 (danger point or obstacle at the left-hand side) / 1,4,1,4 (white / green)  
5 (spar) / 15 (danger point or obstacle at the right-hand side) / 1,3,1,3 (white / red)

## 20.2 Cardinal buoy

IHO Definition: **CARDINAL BUOY**. A cardinal buoy is used in conjunction with the compass to indicate where the mariner may find the best navigable water. It is placed in one of the four quadrants (North, East, South and West), bounded by inter-cardinal bearings from the point marked. (UKHO NP 735, 5<sup>th</sup> Edition).

For IENCs a cardinal buoy is used to mark the position of danger points, obstacles and special features on lakes and broad waterways.

† The attribute/sub-attribute **colour pattern** is mandatory for buoys/topmarks that have more than one value populated for the attribute/sub-attribute **colour**.

Complex attribute **feature name**, sub-attribute **name usage** is mandatory if the name is intended to be displayed when display of names is enabled by the boatmaster. See clause 2.5.8.

For each instance of **fixed date range**, at least one of the sub-attributes **date end** or **date start** must be populated.

For each instance of **information**, at least one of the sub-attributes **file reference** or **text** must be populated.

### 20.2.1 Cardinal buoys

Cardinal marks are used in conjunction with the compass to indicate where a boatmaster may find best navigable water, taking their name from the quadrant in which they are placed in relation to the point marked. The boatmaster should pass N of a North mark, E of an East mark, etc. The shape of cardinal buoys is not significant (although they are usually pillar or spar).

To conform to the IALA Maritime Buoyage System (see clause 18.3.1.1), the body has black and yellow bands, configured with black reflecting the points of the topmark cones (for example black above yellow for north). Black double-cone topmarks are an important feature of cardinal marks and are carried wherever practicable. The points are up for a north mark, down for a south mark, apart for an east mark and together for a west mark. Lights (if fitted) are white Q or VQ, uninterrupted for the north, 3 flashes for east, 6 flashes + LFI for south and 9 flashes for west (resembling an analogue clock).

If it is required to encode a buoy having the function of a cardinal mark, it must be done using the feature **Cardinal Buoy**.

Figure 20-2 – IALA cardinal buoys – Characteristics

Remarks:

- If it is required to encode a buoy or topmark that has more than one colour, the attributes colour and colour pattern must be encoded, according to the rules laid out in clause 2.4.10.
- If it is required to encode the total vertical length, including the topmark and any equipment features (for example light), of the buoy above the water level, it must be done using the attribute vertical length.

Distinction: Emergency Wreck Marking Buoy; Installation Buoy; Isolated Danger Buoy; Lateral Buoy; Mooring Buoy; Safe Water Buoy; Special Purpose/General Buoy.

Inland specific Encoding Instructions:

- Cardinal Buoy** (BOYCAR) must act as a structure feature to a **Light All Around** (LIGHTS) feature (if it exists)
- EUR: The designator as it appears on the buoy, if it can be read from a passing vessel, should be encoded in the attribute **feature name** (OBJNAM). Administrative information on the buoys

that is not relevant for navigation should be encoded in the attribute **information**. It is not repeated for each equipment feature.

- C) If the system of navigational marks of a special sign is different from the system mentioned in the meta feature **Navigational System of Marks**, or there is no meta feature **Navigational System of Marks** in the cell, the attribute **marks navigational – system of** (MARSYS) or **information text** (INFORM) must be used.

## 20.3 Isolated danger buoy

IHO Definition: **ISOLATED DANGER BUOY**. An isolated danger buoy is a buoy moored on or above an isolated danger of limited extent, which has navigable water all around it. (UKHO NP 735, 5<sup>th</sup> Edition).

† The attribute/sub-attribute **colour pattern** is mandatory for buoys/topmarks that have more than one value populated for the attribute/sub-attribute **colour**.

Complex attribute **feature name**, sub-attribute **name usage** is mandatory if the name is intended to be displayed when display of names is enabled by the boatmaster. See clause 2.5.8.

For each instance of fixed date range, at least one of the sub-attributes date end or date start must be populated.

For each instance of information, at least one of the sub-attributes file reference or text must be populated.

### 20.3.1 Isolated danger buoys

Isolated danger buoys are moored above isolated dangers of limited extent with navigable water all around them.

The shape of isolated danger buoys is not significant (although they are usually pillar or spar shaped). To conform to the IALA Maritime Buoyage System (see clause 18.3.1.1), the body is black, with one or more red bands. Black double-sphere topmarks are an important feature of isolated danger buoys and carried wherever practicable. The light (if fitted) is white Fl(2).

If it is required to encode a buoy having the function of an isolated danger mark, it must be done using the feature Isolated Danger Buoy.

Figure 20-3 – IALA isolated danger buoys – Characteristics

Remarks:

- If it is required to encode a buoy or topmark that has more than one colour, the attributes colour and colour pattern must be encoded, according to the rules laid out in clause 2.4.10.
- If it is required to encode the total vertical length, including the topmark and any equipment features (for example light), of the buoy above the water level, it must be done using the attribute vertical length.

Distinction: Cardinal Buoy; Emergency Wreck Marking Buoy; Installation Buoy; Lateral Buoy; Mooring Buoy; Safe Water Buoy; Special Purpose/General Buoy.

Inland specific Encoding Instructions:

- A **Isolated Danger Buoy** (BOYISD) must act as a structure feature to a **Light All Around** (LIGHTS) feature (if it exists).
- B) If there is any complementary characteristic on the buoy body or top mark, it should be described in the attribute **information text** (INFORM).
- C) In the event there is a light on the buoy, the **Isolated Danger Buoy** (BOYISD) feature should be designated as the structure and coded with the name of the light.
- D) BR: The Brazilian national number of the buoy (if it exists) should be encoded in the attribute INFORM or in a PICREP presentation.

## 20.4 Safe water buoy

**IHO Definition: SAFE WATER BUOY.** A safe water buoy is used to indicate that there is navigable water around the mark. (UKHO NP 735, 5<sup>th</sup> Edition).

For IENCs a safe water buoy marking the axis or middle of a channel may be used as a centerline, mid-channel on lakes and broad waterways.

The swinging axial buoys are used to mark swinging points of the fairway axis.

† The attribute/sub-attribute **colour pattern** is mandatory for buoys/topmarks that have more than one value populated for the attribute/sub-attribute **colour**.

Complex attribute **feature name**, sub-attribute **name usage** is mandatory if the name is intended to be displayed when display of names is enabled by the boatmaster. See clause 2.5.8.

For each instance of **fixed date range**, at least one of the sub-attributes **date end** or **date start** must be populated.

For each instance of **information**, at least one of the sub-attributes **file reference** or **text** must be populated.

#### 20.4.1 Safe water buoys

Safe water marks are used to indicate there is safe water all around the mark. It may be used as a centre-line, mid-channel or landfall buoy, or to mark the best point of passage under a bridge.

To conform to the IALA Maritime Buoyage System (see clause 18.3.1.1), the shape of a safe water buoy is spherical, pillar or spar. The body of the mark has red and white vertical stripes. If the shape of the buoy is not spherical a red spherical topmark is carried wherever practicable. The light (if fitted) is white Oc, Iso, LFI or Mo(A) with a period of 10s.

If it is required to encode a buoy having the function of a safe water mark, it must be done using the feature **Safe Water Buoy**.

**Figure 20-4 – IALA safe water buoys – Characteristics**

Remarks:

- If it is required to encode a buoy or topmark that has more than one colour, the attributes colour and colour pattern must be encoded, according to the rules laid out in clause 2.4.10.
- If it is required to encode the total vertical length, including the topmark and any equipment features (for example light), of the buoy above the water level, it must be done using the attribute vertical length.

Distinction: Cardinal Buoy; Emergency Wreck Marking Buoy; Installation Buoy; Isolated Danger Buoy; Lateral Buoy; Mooring Buoy; Special Purpose/General Buoy.

Inland specific Encoding Instructions:

- EUR: The designator as it appears on the buoy, if it can be read from a passing vessel, should be encoded in the attribute **feature name** (OBJNAM). Administrative information on the buoys that is not relevant for navigation should be encoded in the attribute **information** (INFORM). It is not repeated for each equipment feature.
- In case the complex attribute **topmark** (TOPMAR) is added: **topmark/daymark shape** (TOPSHP) = 3 (sphere) and **colour** (COLOUR) = (3 red).
- If the system of navigational marks of a special sign is different from the system mentioned in the metadata feature **Navigational System of Marks** (m\_nsys), or there is no metadata feature **Navigational System of Marks** in the cell, the attribute **marks navigational – system of** (MARSYS) must be used.

## 20.5 Special purpose/general buoy

**IHO Definition: SPECIAL PURPOSE/GENERAL BUOY.** A special purpose buoy is primarily used to indicate an area or feature, the nature of which is apparent from reference to a chart, Sailing Directions or Notices to Mariners. (UKHO NP 735, 5<sup>th</sup> Edition).

For IENCs also buoys to indicate the presence of potentially dangerous obstructions such as groins, banks, or wrecks, buoys to be used as initial marking of a dangerous wreck and supporting pontoons of swinging wire ferries

† The attribute/sub-attribute **colour pattern** is mandatory for buoys/topmarks that have more than one value populated for the attribute/sub-attribute **colour**.

Complex attribute **feature name**, sub-attribute **name usage** is mandatory if the name is intended to be displayed when display of names is enabled by the boatmaster. See clause 2.5.8.

For each instance of **fixed date range**, at least one of the sub-attributes **date end** or **date start** must be populated.

For each instance of **information**, at least one of the sub-attributes **file reference** or **text** must be populated.

### 20.5.1 Special purpose/general buoys

Special marks are used to indicate to the boatmaster a special area or feature, the nature of which is usually apparent from the IENC, paper chart or associated publication. Special marks may also be used to mark a channel within a channel, using yellow buoys of the appropriate lateral shape, or yellow spherical buoys to mark the centreline. A special buoy may be any shape but must not conflict with lateral or safe water marks (for example an outfall buoy on the port-side of a channel could be can but should not be conical).

To conform to the IALA Maritime Buoyage System (see clause 18.3.1.1), the body of the buoy is yellow. The topmark (if fitted) is a yellow diagonal 'X' (St Andrew's cross). Lights (if fitted) are yellow and of any rhythm except those used for cardinal, isolated danger and safe water marks.

If it is required to encode a buoy having the function of a special purpose mark, or a buoy whose appearance or purpose is inadequately known, it must be done using the feature **Special Purpose/General Buoy**.

In the following Table, a blank indicates that the encoder may choose a relevant value for the attribute. The Table contains the most common examples of coding in maritime ENCs; other coding combinations are possible for **Special Purpose/General Buoy** features.

| Feature                 | Feature                             | buoy shape | category of special purpose mark | Other attributes |
|-------------------------|-------------------------------------|------------|----------------------------------|------------------|
| Firing danger area buoy | <b>Special Purpose/General Buoy</b> |            | 1                                |                  |
| Target                  | <b>Special Purpose/General Buoy</b> |            | 2                                |                  |
| Marker ship             | <b>Special Purpose/General Buoy</b> |            | 3                                |                  |

|                                               |                              |   |                    |                                                                 |
|-----------------------------------------------|------------------------------|---|--------------------|-----------------------------------------------------------------|

| Buoy marking wave recorder (or current meter) | Special Purpose/General Buoy |   | 63                 |                                                                 |

**Table 20-1 – IALA special purpose buoys – Common types**

**Remarks:**

If it is required to encode a buoy or topmark that has more than one colour, the attributes **colour** and **colour pattern** must be encoded, according to the rules laid out in clause 2.4.10.

If it is required to encode the total vertical length, including the topmark and any equipment features (for example light), of the buoy above the water level, it must be done using the attribute **vertical length**.

If a special purpose buoy does not conform to the system of navigational marks defined by **Navigational System of Marks** (see clause 3.6), the attribute **marks navigational – system of** on the **Special Purpose/General Buoy** should be populated as 9 (no system).

Fish havens (sometimes referred to as subsurface Fish Aggregating Devices (FAD)) and subsurface Ocean Data Acquisition System (ODAS) equipment must be encoded, where required, using an **Obstruction** feature (see clause 13.6).

A buoy deployed as an emergency measure to mark a newly identified danger, such as a wreck, must be encoded using the feature **Emergency Wreck Marking Buoy** (see clause 20.6). A special purpose buoy intended to permanently mark a wreck as a danger must be encoded,

where required, as a **Special Purpose/General Buoy** feature, with attribute **category of special purpose mark** = 60 (wreck mark).

Distinction: Cardinal Buoy; Emergency Wreck Marking Buoy; Installation Buoy; Isolated Danger Buoy; Lateral Buoy; Mooring Buoy; Safe Water Buoy.

Inland specific Encoding Instructions:

- A) EUR: The designator as it appears on the buoy, if it can be read from a passing vessel, should be encoded in the attribute **feature name** (OBJNAM). Administrative information on the buoys that is not relevant for navigation should be encoded in the attribute **information**. It is not repeated for each equipment feature.
- B) If the system of navigational marks of a special sign is different from the system mentioned in the metadata feature **Navigational System of Marks** (m\_nsys), or there is no **Navigational System of Marks** (m\_nsys) metadata feature in the cell, the attribute **marks navigational – system of** (MARSYS), must be used.
- C) Buoy marking danger point
  - i) EUR: If buoys according to main European inland waterway marking system are used feature **Lateral Buoy** (boylat) has to be used.
  - ii) US: Use **information text** (INFORM) to note the river tender or vessel used to place/set buoy
  - iii) EUR: If not under the issuing authority, use **information text** (INFORM) to indicate responsibility of operation of the buoy.
- D) Emergency Wreck Marking Buoy
  - i) If it is required to encode an emergency wreck marking buoy, it must be done using the feature **Emergency Wreck Marking Buoy** (clause 20.6). Only if a general buoy is used to mark a wreck a **Special Purpose/General Buoy** (BOYSPP) feature has to be encoded. In this case ii) and iii) are applicable.
  - ii) **Special Purpose/General Buoy** (BOYSPP) is encoded as structure feature to the light feature and the radar transponder beacon feature.
  - iii) EUR: The designator as it appears on the buoy, if it can be read from a passing vessel, should be encoded in the attribute OBJNAM.  
Administrative information on the buoys that is not relevant for navigation should be encoded in the attribute **information**. It is not repeated for each equipment feature.
- E) For buoys at bifurcation of the channel according to IALA: If there is no preference to pass **Special Purpose/General Buoy** (BOYSPP) with **category of special purpose mark** (CATSPM) = 54 (channel separation mark) is used
- F) For supporting pontoons of swinging wire ferries use **Special Purpose/General Buoy** (BOYSPP) with **category of special purpose mark** (CATSPM) = 37 (ferry crossing mark).

## 20.6 Emergency wreck marking buoy

**IHO Definition:** **EMERGENCY WRECK MARKING BUOY.** An emergency wreck marking buoy is a buoy moored on or above a new wreck, designed to provide a prominent (both visual and radio) and easily identifiable temporary first response. (Adapted from UKHO NP 735, 6<sup>th</sup> Edition).

† The attribute/sub-attribute **colour pattern** is mandatory for buoys/topmarks that have more than one value populated for the attribute/sub-attribute **colour**.

Complex attribute **feature name**, sub-attribute **name usage** is mandatory if the name is intended to be displayed when display of names is enabled by the boatmaster. See clause 2.5.8.

For each instance of **fixed date range**, at least one of the sub-attributes **date end** or **date start** must be populated.

For each instance of **information**, at least one of the sub-attributes **file reference** or **text** must be populated.

### 20.6.1 Emergency wreck marking buoys

Emergency wreck marking buoys are used to mark new wrecks until a permanent form of marking has been established and the wreck itself has been promulgated by Notice to Mariners, or removed.

To conform to the IALA Maritime Buoyage System (see clause 18.3.1.1), the shape of an emergency wreck marking buoy is pillar or spar. The body of the mark has blue and yellow vertical stripes. The topmark (if fitted) is a standing/upright yellow '+' (St. George's cross). Lights (if fitted) are Al.Oc.BuY.3s. If it is required to encode a buoy having the function of an emergency wreck mark, it must be done using the feature **Emergency Wreck Marking Buoy**.

Remarks:

- If it is required to encode a buoy or topmark that has more than one colour, the attributes **colour** and **colour pattern** must be encoded, according to the rules laid out in clause 2.4.10.
- If it is required to encode the total vertical length, including the topmark and any equipment features (for example light), of the buoy above the water level, it must be done using the attribute **vertical length**.
- An IALA compliant emergency wreck marking buoy topmark should be populated using the complex attribute **topmark**, with sub-attributes **topmark shape** = 8 (upright cross) and **colour** = 6 (yellow).
- An IALA compliant emergency wreck marking buoy should also have the following associated equipment features:
  - A **Light All Around** feature (see clause 19.2), with attributes **colour** = 5,6 (blue, yellow), **light characteristic** = 17 (occulting alternating), **signal group** = (1) and **signal period** = 3. The complex attribute **signal sequence**, sub-attributes **signal duration** and **signal status**, should be populated equivalent to (00.50)+01.00+(00.50)+01.00 (bracketed values corresponding to periods of eclipse and non-bracketed values corresponding to periods of light); and the attribute **value of nominal range** should be populated as 4.
  - A **Radar Transponder Beacon** feature (see clause 21.4), with attributes **category of radar transponder beacon** = 2 (racon, radar transponder beacon) and **signal group** = (D).

Distinction: Cardinal Buoy; Installation Buoy; Lateral Buoy; Mooring Buoy; Safe Water Buoy; Special Purpose/General Buoy.

#### Inland specific Encoding Instructions:

- A) **Emergency Wreck Marking Buoy** is encoded as structure feature to the light feature and the radar transponder beacon feature.
- B) EU: The designator as it appears on the buoy, if it can be read from a passing vessel, should be encoded in the attribute **feature name** (OBJNAM).  
Administrative information on the buoys that is not relevant for navigation should be encoded in the attribute **information**. It is not repeated for each equipment feature.

## 20.7 Installation buoy

IHO Definition: **INSTALLATION BUOY.** An installation buoy is a buoy used for loading tankers with gas or oil. (S-57 Edition 3.1, Appendix A – Chapter 1, Page 1.20, November 2000).

† The attribute **colour pattern** is mandatory for buoys that have more than one value populated for the attribute **colour**.

Complex attribute **feature name**, sub-attribute **name usage** is mandatory if the name is intended to be displayed when display of names is enabled by the boatmaster. See clause 2.5.8.

For each instance of **fixed date range**, at least one of the sub-attributes **date end** or **date start** must be populated.

For each instance of **information**, at least one of the sub-attributes **file reference** or **text** must be populated.

### 20.7.1 Installation buoys

Although the oil and gas from some fields are sent ashore by submarine pipeline, a variety of mooring systems have been developed for use in deep water and in the vicinity of certain ports, to allow the loading of large vessels and the permanent mooring of floating storage vessels or units. These offshore systems include large mooring buoys, designed for mooring vessels up to 500,000 tonnes, and platforms on structures fixed at their lower ends to the seafloor. They allow a vessel to moor forward or aft to them, and to swing to the wind or stream, and are termed installation buoys.

If it is required to encode an installation buoy, it must be done using the feature **Installation Buoy**.

#### Remarks:

- If it is required to encode a buoy that has more than one colour, the attributes **colour** and **colour pattern** must be encoded, according to the rules laid out in clause 2.4.10.

Distinction: Mooring Buoy; Offshore Platform; Special Purpose/General Buoy.

#### Inland specific Encoding Instructions:

---

## 20.8 Mooring buoy

**IHO Definition: MOORING BUOY.** A buoy secured to the bottom by permanent moorings with means for mooring a vessel by use of its anchor chain or mooring lines. (IHO Dictionary – S-32).

### **S-401 Geo Feature: Mooring Buoy (MORFAC) (C)**

† The attribute **colour pattern** is mandatory for buoys that have more than one value populated for the attribute **colour**.

Complex attribute **feature name**, sub-attribute **name usage** is mandatory if the name is intended to be displayed when display of names is enabled by the boatmaster. See clause 2.5.8.

For each instance of **fixed date range**, at least one of the sub-attributes **date end** or **date start** must be populated.

For each instance of **information**, at least one of the sub-attributes **file reference** or **text** must be populated.

### 20.8.1 Mooring buoys

Mooring buoys must be shown on charts of appropriate scale to indicate buoys and moored vessels as possible hazards to navigation as well as, on the largest scales, to facilitate mooring operations.

If it is required to encode a mooring buoy, it must be done using the feature **Mooring Buoy**.

#### Remarks:

- If it is required to encode a buoy that has more than one colour, the attributes **colour** and **colour pattern** must be encoded, according to the rules laid out in clause 2.4.10.
- If it is required to encode the total vertical length, including any equipment features (for example light), of the buoy above the water level, it must be done using the attribute **vertical length**.
- If it is required to encode a visitors mooring, it must be done by populating the attribute **visitors mooring** as *True*.

Distinction: Mooring Area; Mooring Trot; Small Craft Facility; Special Purpose/General Buoy.

#### Inland specific Encoding Instructions:

- A) Mooring buoys have to be encoded if they are in navigable water.

## 20.9 Lateral beacon

**IHO Definition: LATERAL BEACON.** A lateral beacon is used to indicate the port or starboard hand side of the route to be followed. They are generally used for well defined channels and are used in conjunction with a conventional direction of buoyage. (UKHO NP 735, 5<sup>th</sup> Edition).

For IENCs also beacons that are used to mark specific “Landmarks” and submerged banks.

† The attribute/sub-attribute **colour pattern** is mandatory for beacons/topmarks that have more than one value populated for the attribute/sub-attribute **colour**.

Complex attribute **feature name**, sub-attribute **name usage** is mandatory if the name is intended to be displayed when display of names is enabled by the boatmaster. See clause 2.5.8.

For each instance of **fixed date range**, at least one of the sub-attributes **date end** or **date start** must be populated.

For each instance of **information**, at least one of the sub-attributes **file reference** or **text** must be populated.

### 20.9.1 Lateral Beacons

Lateral beacons are generally used for well defined channels, in conjunction with a direction of buoyage. They indicate the port and starboard sides of the route to be followed.

To conform to the IALA Maritime Buoyage System (see clause 18.3.1.1), port hand beacons have a can shaped topmark. The colour of port hand beacons, topmarks and lights (if fitted) will be red in IALA region A and green in IALA region B.

To conform to the IALA Maritime Buoyage System, starboard hand beacons have a conical shaped topmark. The colour of starboard hand beacons, topmarks and lights (if fitted) will be green in IALA region A and red in IALA region B.

A preferred channel beacon is a modified lateral beacon, with horizontal colour bands. The predominant colour indicates which side is the preferred channel, the other colour indicates the secondary channel. If fitted, the light is Fl(2+1), the colour indicating the preferred channel.

If it is required to encode a beacon having the function of a lateral mark, it must be done using the feature **Lateral Beacon**.

*Figure 20-5 – IALA lateral beacons – Characteristics*

Remarks:

- If it is required to encode a beacon or topmark that has more than one colour, the attributes **colour** and **colour pattern** must be encoded, according to the rules laid out in clause 2.4.10.
- For guidance on the encoding of the attributes **elevation**, **height** and **vertical length** see clause 2.5.7. **elevation** applies only to beacons on land. Values populated for **height** and **vertical length** must include the topmark and any equipment features.
- If it is required to encode a cairn that bears the colour(s) specified by a navigational system of marks, it must be done using a beacon feature.

Distinctions: Cardinal Beacon; Daymark; Isolated Danger Beacon; Safe Water Beacon; General Beacon.

Inland specific Encoding Instructions:

- A) **Lateral Beacon** (BCNLAT, bcnlata) must be defined as the structure feature, with **Daymark** (DAYMAR, daymar) as the equipment feature.
- B) Lateral Beacon as carrier of a Day Mark
  - i) In the event there is a light on the day mark, the **Lateral Beacon** (BCNLAT, bcnlata) feature should be designated as the structure feature and coded with the name of the light.
  - ii) EUR: The designator as it appears on the **Lateral Beacon** (BCNLAT, bcnlata), if it can be read from a passing vessel, should be encoded in the attribute **feature name** (OBJNAM). Administrative information on the beacon that is not relevant for navigation should be encoded in the attribute **information**. It is not repeated for each equipment feature.
  - iii) US: **feature name** (OBJNAM) of **Lateral Beacon** (BCNLAT, bcnlata) must be the name designated by the US Coast Guard Light List followed by the river mile, e.g., Debutte Light and Daymark (233.4). **Feature name** (OBJNAM) should not be repeated for each equipment feature.

- C) Change Bank (Used only in the Po river (Italy))
  - i) 'Change bank' marks are used in pairs (two equal marks, one on each bank); the alignment of the two marks indicates the track to be followed for crossing the river. Single 'change bank' marks are only used in combination with the 'touch and go' mark.
  - ii) Referring to navigation in the downstream direction, if it is placed on the right bank, it indicates that you have to move to the other bank; if it is placed on the left bank, it indicates that you have to approach the bank. Ships must always move in the direction indicated by the white triangle.
  - iii) Encode **category of lateral mark** (CATLAM) with 26 (change bank)
- D) Continue Along Bank (Used only in the Po river (Italy))
  - i) 'Continue along bank' marks are used to indicate that the recommended track continues along the bank on which it is placed.
  - ii) Referring to navigation in both directions, it generally follows a 'Change bank' mark.
  - iii) It is repeated about every 0.5 km, until the next 'Change bank' mark.
  - iv) Encode **category of lateral mark** (CATLAM) with 27 (continue along the bank)
- E) Touch and Go (Used only in the Po river (Italy))
  - i) It is used instead of two consecutive 'Change bank' marks, which should be placed very close on the same bank, to indicate that the recommended track changes again to the previous side of the waterway.
  - ii) It is preceded and followed by two 'Change bank' marks, both on the opposite bank of the waterway.
  - iii) Encode **category of lateral mark** (CATLAM) with 26 (change bank)

## 20.10 Cardinal beacon

**IHO Definition: CARDINAL BEACON.** A cardinal beacon is used in conjunction with the compass to indicate where the mariner may find the best navigable water. It is placed in one of the four quadrants (North, East, South and West), bounded by inter-cardinal bearings from the point marked. (UKHO NP 735, 5<sup>th</sup> Edition).

<sup>†</sup> The attribute/sub-attribute **colour pattern** is mandatory for beacons/topmarks that have more than one value populated for the attribute/sub-attribute **colour**.

Complex attribute **feature name**, sub-attribute **name usage** is mandatory if the name is intended to be displayed when display of names is enabled by the boatmaster. See clause 2.5.8.

For each instance of **fixed date range**, at least one of the sub-attributes **date end** or **date start** must be populated.

For each instance of **information**, at least one of the sub-attributes **file reference** or **text** must be populated.

#### 20.10.1 Cardinal beacons

Cardinal marks are used in conjunction with the compass to indicate where a boatmaster may find best navigable water, taking their name from the quadrant in which they are placed in relation to the point marked. The boatmaster should pass N of a North mark, E of an East mark, etc.

To conform to the IALA Maritime Buoyage System (see clause 18.3.1.1), the body of the beacon has black and yellow bands, configured with black reflecting the points of the topmark cones (for example black above yellow for north). Black double-cone topmarks are an important feature of cardinal marks and are carried wherever practicable. The points are up for a north mark, down for a south mark, apart for an east mark and together for a west mark. Lights (if fitted) are white Q or VQ, uninterrupted for the north, 3 flashes for east, 6 flashes + LFI for south and 9 flashes for west (resembling an analogue clock).

If it is required to encode a beacon having the function of a cardinal mark, it must be done using the feature **Cardinal Beacon**.

## IALA MARITIME BUOYAGE SYSTEM CARDINAL MARKS REGIONS A AND B

**Figure 20-6 – IALA cardinal beacons – Characteristics**

### Remarks:

- If it is required to encode a beacon or topmark that has more than one colour, the attributes **colour** and **colour pattern** must be encoded, according to the rules laid out in clause 2.4.10.
- For guidance on the encoding of the attributes **elevation**, **height** and **vertical length** see clause 2.5.7. **elevation** applies only to beacons on land. Values populated for **height** and **vertical length** must include the topmark and any equipment features.
- If it is required to encode a cairn that bears the colour(s) specified by a navigational system of marks, it must be done using a beacon feature.

**Distinction:** Daymark; Isolated Danger Beacon; Lateral Beacon; Safe Water Beacon; Special Purpose/General Beacon.

### Inland specific Encoding Instructions:

- EUR: The designator as it appears on the beacon, if it can be read from a passing vessel, should be encoded in the attribute **feature name** (OBJNAM). Administrative information on the beacon that is not relevant for navigation should be encoded in the attribute **information**. It is not repeated for each equipment feature.
- If the system of navigational marks of a special sign is different from the system mentioned in the metadata feature **Navigational System of Marks** (m\_nsys), or there is no **Navigational System of Marks** (m\_nsys) metadata feature in the cell, the attribute **marks navigational – system of** (MARSYS) must be used.

## 20.11 Isolated danger beacon

**IHO Definition: ISOLATED DANGER BEACON.** An isolated danger beacon is a beacon erected on an isolated danger of limited extent, which has navigable water all around it. (UKHO NP735, 5<sup>th</sup> Edition).

| <p>† The attribute/sub-attribute <b>colour pattern</b> is mandatory for beacons/topmarks that have more than one value populated for the attribute/sub-attribute <b>colour</b>.</p> <p>Complex attribute <b>feature name</b>, sub-attribute <b>name usage</b> is mandatory if the name is intended to be displayed when display of names is enabled by the boatmaster. See clause 2.5.8.</p> <p>For each instance of <b>fixed date range</b>, at least one of the sub-attributes <b>date end</b> or <b>date start</b> must be populated.</p> <p>For each instance of <b>information</b>, at least one of the sub-attributes <b>file reference</b> or <b>text</b> must be populated.</p> <p><b>20.11.1 Isolated danger beacons</b></p> <p>Isolated danger beacons are placed on isolated dangers of limited extent with navigable water all around them.</p> <p>To conform to the IALA Maritime Buoyage System (see clause 18.3.1.1), the body of an isolated danger beacon is black, with one or more red bands. Black double-sphere topmarks are an important feature of isolated danger beacons and carried wherever practicable. The light (if fitted) is white Fl(2).</p> <p>If it is required to encode a beacon having the function of an isolated danger mark, it must be done using the feature <b>Isolated Danger Beacon</b>.</p> |                                                         |                                                                                                                                                                                                  |             |              |

*Figure 20-7 – IALA isolated danger beacons – Characteristics*

Remarks:

- If it is required to encode a beacon or topmark that has more than one colour, the attributes **colour** and **colour pattern** must be encoded, according to the rules laid out in clause 2.4.10.
- For guidance on the encoding of the attributes **elevation**, **height** and **vertical length** see clause 2.5.7 **elevation** applies only to beacons on land. Values populated for **height** and **vertical length** must include the topmark and any equipment features.
- If it is required to encode a cairn that bears the colour(s) specified by a navigational system of marks, it must be done using a beacon feature.

Distinction: Cardinal Beacon; Daymark; Lateral Beacon; Safe Water Beacon; Special Purpose/General Beacon.

Inland specific Encoding Instructions:

- BR: If there is any complementary characteristic on the beacon, it should be described in the attribute **information** (INFORM).
- In the event there is a light on the beacon, the **Isolated Danger Beacon** (BCNISD) feature should be designated as the structure and coded with the name of the light.
- BR: The national number of the beacon (if it exists) should be encoded in the attribute **information** It is not repeated for each equipment feature.

## 20.12 Safe water beacon

† The attribute/sub-attribute **colour pattern** is mandatory for beacons/topmarks that have more than one value populated for the attribute/sub-attribute **colour**.

Complex attribute **feature name**, sub-attribute **name usage** is mandatory if the name is intended to be displayed when display of names is enabled by the boatmaster. See clause 2.5.8.

For each instance of **fixed date range**, at least one of the sub-attributes **date end** or **date start** must be populated.

For each instance of **information**, at least one of the sub-attributes **file reference** or **text** must be populated.

### 20.12.1 Safe water beacons

Safe water marks are used to indicate there is safe water all around the mark. It may be used as a centre-line, mid-channel or landfall beacon, or to mark the best point of passage under a bridge.

To conform to the IALA Maritime Buoyage System (see clause 18.3.1.1), the body of the mark has red and white vertical stripes. A red spherical topmark is an important feature and carried wherever practicable. The light (if fitted) is white Oc, Iso, LFI or Mo(A) with a period of 10s.

If it is required to encode a beacon having the function of a safe water mark, it must be done using the feature **Safe Water Beacon**.

Figure 20-8 – IALA safe water beacons – Characteristics

#### Remarks:

- If it is required to encode a beacon or topmark that has more than one colour, the attributes **colour** and **colour pattern** must be encoded, according to the rules laid out in clause 2.4.10.
- For guidance on the encoding of the attributes **elevation**, **height** and **vertical length** see clause 2.5.7. **elevation** applies only to beacons on land. Values populated for **height** and **vertical length** must include the topmark and any equipment features.

- If it is required to encode a cairn that bears the colour(s) specified by a navigational system of marks, it must be done using a beacon feature.

Distinction: Cardinal Beacon; Daymark; Isolated Danger Beacon; Lateral Beacon; Special Purpose/General Beacon.

Inland specific Encoding Instructions:

- A) EUR: The designator as it appears on the beacon, if it can be read from a passing vessel, should be encoded in the attribute **feature name** (OBJNAM). Administrative information on the beacon that is not relevant for navigation should be encoded in the attribute **information**. It is not repeated for each equipment feature.
- B) In case the attribute **topmark** (TOPMAR) is added: **topmark/daymark shape** (TOPSHP) = 3 (sphere) and **colour** (COLOUR) = (3 (red)).
- C) If the system of navigational marks of a special sign is different from the system mentioned in the metadata feature **Navigational System of Marks** (m\_nsys), or there is no **Navigational System of Marks** (m\_nsys) metadata feature in the cell, the attribute **marks navigational – system of** (MARSYS) must be used.

## 20.13 Special purpose/general beacon

| <b>IHO Definition:</b> <b>SPECIAL PURPOSE/GENERAL BEACON.</b> A special purpose beacon is primarily used to indicate an area or feature, the nature of which is apparent from reference to a chart, Sailing Directions or Notices to Mariners. (UKHO NP 735, 5 <sup>th</sup> Edition). |                           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |      |              |

| -                     | <b>Spatial Association</b> (see clause 25.10)   | <b>Spatial Quality</b>                       | Association | 0,* |

† The attribute/sub-attribute **colour pattern** is mandatory for beacons/topmarks that have more than one value populated for the attribute/sub-attribute **colour**.

Complex attribute **feature name**, sub-attribute **name usage** is mandatory if the name is intended to be displayed when display of names is enabled by the boatmaster. See clause 2.5.8.

For each instance of **fixed date range**, at least one of the sub-attributes **date end** or **date start** must be populated.

For each instance of **information**, at least one of the sub-attributes **file reference** or **text** must be populated.

### 20.13.1 Special purpose/general beacons

Special beacons are used to indicate to the boatmaster a special area or feature, the nature of which is usually apparent from the chart or associated publication.

To conform to the IALA Maritime Buoyage System (see clause 18.3.1.1), the body of the beacon is yellow. The topmark (if fitted) is a yellow diagonal 'X' (St Andrew's cross). Lights (if fitted) are yellow and of any rhythm except those used for cardinal, isolated danger and safe water marks.

If it is required to encode a beacon having the function of a special purpose mark, or a beacon whose appearance or purpose is inadequately known, it must be done using the feature **Special Purpose/General Beacon**.

In the following Table, a blank indicates that the encoder may choose a relevant value for the attribute. The Table contains the most common examples of coding for maritime ENC's; other coding combinations are possible.

| Feature                          | Feature                               | beacon shape | category of special purpose mark |
|----------------------------------|---------------------------------------|--------------|----------------------------------|
| Minor not permanent mark         | <b>Beacon ***</b>                     | 1            |                                  |
| Cairn                            | <b>Beacon ***</b>                     | 6            |                                  |
| Beacon tower                     | <b>Beacon ***</b>                     | 3            |                                  |
| Lattice beacon                   | <b>Beacon ***</b>                     | 4            |                                  |
| Leading beacon                   | <b>Special Purpose/General Beacon</b> |              | 16                               |
| Beacon marking a clearing line   | <b>Special Purpose/General Beacon</b> |              | 41                               |
| Beacon marking measured distance | <b>Special Purpose/General Beacon</b> |              | 17                               |
| Cable landing beacon             | <b>Special Purpose/General Beacon</b> |              | 6                                |
| Outfall landing beacon           | <b>Special Purpose/General Beacon</b> |              | 8                                |
| Pipeline landing beacon          | <b>Special Purpose/General Beacon</b> |              | 39                               |

|                             |                                       |   |    |
|-----------------------------|---------------------------------------|---|----|
| Refuge beacon               | <b>Special Purpose/General Beacon</b> |   | 44 |
| Firing practice area beacon | <b>Special Purpose/General Beacon</b> |   | 1  |
| Notice board                | <b>Special Purpose/General Beacon</b> |   | 18 |
| Buoyant beacon              | <b>Special Purpose/General Beacon</b> | 7 |    |

**Table 20-2 – IALA special purpose beacons – Common types**

**Remarks:**

- Non-beacon structures (for example chimneys, masts, towers) that are also used to serve the purpose of a special purpose beacon must be encoded, where required, using the feature **Landmark** (see clause 7.2).
- If it is required to encode a beacon or topmark that has more than one colour, the attributes **colour** and **colour pattern** must be encoded, according to the rules laid out in clause 2.4.10.
- For guidance on the encoding of the attributes **elevation**, **height** and **vertical length** see clause 2.5.7. **elevation** applies only to beacons on land. Values populated for **height** and **vertical length** must include the topmark and any equipment features.
- If a special purpose beacon does not conform to the system of navigational marks defined by **Navigational System of Marks** (see clause 3.6), the attribute **marks navigational – system of** on the **Special Purpose/General Beacon** should be encoded. If the beacon does not belong to any of the listed systems 9 (no system) has to be encoded.
- If it is required to encode a cairn that bears the colour(s) specified by a navigational system of marks, it must be done using a beacon feature.

### 20.13.2 Signs and notice boards

If it is required to encode a fixed or floating sign or notice board, it must be done using a **Special Purpose/General Beacon** feature or **Special Purpose/General Buoy** feature (see clause 20.5), with attribute **category of special purpose mark** = 18 (notice mark), or using the feature **Daymark** (see clause 20.14).

**Remarks:**

- If it is required to encode a sign or notice board that has more than one colour, the attributes **colour** and **colour pattern** must be used, according to the rules laid out in clause 2.4.10.
- If it is required to encode any text shown on a notice board or sign, it must be done using the complex attribute **information** (see clause 2.4.6).
- If it is required to encode the shape and colour of a notice board, it must be done by encoding the board as a **Daymark** feature.

**Distinction:** Cardinal Beacon; Daymark; Isolated Danger Beacon; Landmark; Lateral Beacon; Safe Water Beacon.

**Inland specific Encoding Instructions:**

- A) EUR: The designator as it appears on the beacon, if it can be read from a passing vessel, should be encoded in the attribute **feature name** (OBJNAM). Administrative information on the buoys that is not relevant for navigation should be encoded in the attribute **information**. It is not repeated for each equipment feature.
- B) If the system of navigational marks of a special sign is different from the system mentioned in the metadata feature **Navigational System of Marks** (m\_nsys), or there is no **Navigational System of Marks** (m\_nsys) metadata feature in the cell, the attribute **marks navigational – system of** (MARSYS) must be used.

## 20.14 Daymark

**IHO Definition: DAYMARK.** The identifying characteristics of an aid to navigation which serve to facilitate its recognition against a daylight viewing background. On those structures that do not by themselves present an adequate viewing area to be seen at the required distance, the aid is made more visible by affixing a daymark to the structure. A daymark so affixed has a distinctive colour and shape depending on the purpose of the aid. (IHO Dictionary – S-32, Edition 5).  
For IENCs daymarks are used to code passing and crossing day beacons on the inland river system.

<sup>†</sup> The attribute **colour pattern** is mandatory for daymarks that have more than one value populated for the attribute **colour**.

Complex attribute **feature name**, sub-attribute **name usage** is mandatory if the name is intended to be displayed when display of names is enabled by the boatmaster. See clause 2.5.8.

For each instance of **fixed date range**, at least one of the sub-attributes **date end** or **date start** must be populated.

For each instance of **information**, at least one of the sub-attributes **file reference** or **text** must be populated.

### 20.14.1 Daymarks

If it is required to encode a daymark, it must be done using the feature **Daymark**.

The term “daymark” may also simply refer to any unlighted aid to navigation, particularly for leading marks. In North America, the term “daybeacon” is used for an unlit beacon.

In the following Table, a blank indicates that the encoder may choose a relevant value for the attribute. The Table contains the most common examples of coding for maritime ENC; other coding combinations are possible.

| Feature                                       | Feature | category of special purpose mark | Other attributes           |
|-----------------------------------------------|---------|----------------------------------|----------------------------|
| Coloured or white mark                        | Daymark |                                  | nature of construction = 9 |
| Coloured topmark with function of beacon      | Daymark |                                  | nature of construction = 9 |
| Painted board with function of leading beacon | Daymark | 16                               | topmark shape = 6          |

Table 20-3 – Daymarks – Examples

#### Remarks:

- For guidance on the encoding of the attributes **elevation**, **height** and **vertical length** see clause 2.5.7. **elevation** applies only to daymarks on land. Values populated for **height** and **vertical length** must include any equipment features.
- If it is required to encode a cairn that bears the colour(s) specified by a navigational system of marks, it must be done using a beacon feature.
- If it is required to encode an aid to navigation that may be considered to be a topmark but has multiple colours that are considered important for navigation, this should be done using **Daymark**.
- If it is required to encode a daymark that has more than one colour, the attributes **colour** and **colour pattern** must be encoded, according to the rules laid out in clause 2.4.10. If the colour pattern for the daymark is complex, it is strongly recommended that an image of the daymark is included, using the attribute **pictorial representation**.

**Distinction:** Cardinal Beacon; Isolated Danger Beacon; Lateral Beacon; Safe Water Beacon; Special Purpose/General Beacon; Topmark.

#### Inland specific Encoding Instructions:

- EUR: For marks with **marks navigational – system of** (MARSYS) = 11 indicating the position of the channel the **Daymark** (DAYMAR, daymar) **colour** (COLOUR)/ **colour pattern** (COLPAT)/ **topmark/daymark shape** (TOPSHP) attributes must be used in the following combinations: 1, 3, 1 (white, red, white), 1 (horizontal stripes) and 19 (square) for the right hand shore or 4, 1 (green, white), 1 (horizontal stripes) and 12 (rhombus (diamond)) for the left hand shore.
- EUR: For marks with **marks navigational – system of** (MARSYS) = 11 indicating danger points **Daymark** (DAYMAR, daymar) **colour** (COLOUR)/ **topmark/daymark shape** (TOPSHP)

attributes must be used in the following combinations:  
 3 (red) and 2 (cone, point down) for the right hand shore or  
 4 (green) and 1 (cone, point up) for the left hand shore

- C) US: For daybeacons with more than one colour, such as a crossing or non-laterally significant daybeacon, use multiple **colour** (COLOUR) attributes and populate the **colour pattern** (COLPAT) attribute based upon the colour pattern of the daybeacon. For example, a NR daybeacon would be encoded as **colour** (COLOUR) = 1,3 with **topmark/daymark shape** (TOPSHP) = 12 (rhombus(diamond)), and **colour pattern** (COLPAT) = 4 (squared).
- D) Code two **Daymark** (DAYMAR, daymar) features at the same location if two different daymarks are present. Use **direction of impact** (DIRIMP) to designate whether the **Daymark** impacts up-bound or down-bound traffic. If only 1 **Daymark** is present but only impacts one direction, **direction of impact** (DIRIMP) should also be used.
- E) If two **Daymark** (DAYMAR, daymar) features are at the same location, as in letter D, for the **Daymark** that is visible to up-bound vessels code **orientation value** (ORIENT) to indicate the heading of an up-bound vessel parallel to the riverbank (North = 0 degrees) and for the **Daymark** that is visible to down-bound vessels code **orientation value** (ORIENT) to indicate the heading of a down-bound vessel parallel to the riverbank.
- F) Change bank Daymarks on the Po river in Italy
  - i) 'Change bank' marks are used in pairs (two equal marks, one on each bank); the alignment of the two marks indicates the track to be followed for crossing the river. Single 'change bank' marks are only used in combination with the 'touch and go' mark.
  - ii) Referring to navigation in the downstream direction, if it is placed on the right bank, it indicates that you have to move to the other bank; if it is placed on the left bank, it indicates that you have to approach the bank. Ships must always move in the direction indicated by the white triangle.
  - iii) **colour** (COLOUR) = [1 (white), 3 (red)] when, navigating in the downstream direction, the ship has to move to the left bank, or when navigating in the upstream direction, the ship has to move to the right bank.
  - iv) **colour** (COLOUR) = [3 (red), 1 (white)] when, navigating in the downstream direction, the ship has to move to the right bank, or when navigating in the upstream direction, the ship has to move to the left bank.
- G) Continue along bank Daymarks on the Po river in Italy
  - i) 'Continue along bank' marks are used to indicate that the recommended track continues along the bank on which it is placed.
  - ii) Referring to navigation in both directions, it generally follows a 'Change bank' mark.
  - iii) It is repeated about every 0.5 km, until the next 'Change bank' mark.
  - iv) In this case **colour** (COLOUR) has to be always encoded as [1,3].
- H) Touch and go Daymarks on the Po river in Italy
  - i) It is used instead of two consecutive 'Change bank' marks, which should be placed very close on the same bank, to indicate that the recommended track changes again to the previous side of the waterway.
  - ii) It is preceded and followed by two 'Change bank' marks, both on the opposite bank of the waterway.
  - iii) In this case **colour** (COLOUR) has to be always encoded as [3,1].

## Radar reflector

IHO Definition: **RADAR REFLECTOR**. A device capable of, or intended for, reflecting radar signals. (IHO Dictionary – S-32).

### **S-401 Geo Feature: Radar Reflector (RADRFL) (C)**

#### **Primitives: Point**

† For each instance of **fixed date range**, at least one of the sub-attributes **date end** or **date start** must be populated.

For each instance of **information**, at least one of the sub-attributes **file reference** or **text** must be populated.

Complex attribute **feature name**, sub-attribute **name usage** is mandatory if the name is intended to be displayed when display of names is enabled by the boatmaster. See clause 2.5.8.

### 20.15.1 Radar reflectors

#### Remarks:

- A radar reflector is usually a tetrahedron or pentagonal corner reflector to facilitate reflection towards the sender. (International Maritime Dictionary, 2<sup>nd</sup> Edition).
- If it is required to encode a feature which has no radar reflector, but is radar conspicuous, it must be indicated using the mandatory attribute **radar conspicuous** = *True* on the feature.
- Where the location of a radar reflector(s) is known on an overhead cable or pipeline, a **Radar Reflector(s)** should be encoded, and associated to the **Cable Overhead** or **Pipeline Overhead** using a **Structure/Equipment** feature association (see clauses 6.10, 6.11 and 25.12).
- If it is required to encode a surface or point feature which is radar conspicuous because it is fitted with a radar reflector, it must be indicated using **radar conspicuous** = *True* on the feature. A **Radar Reflector** feature must not be encoded in this case.

#### Distinction:

#### Inland specific Encoding Instructions:

- A) Radar reflectors have to be encoded as feature if they are not encoded as an attribute of another feature.

## 20.16 Fog signal

**IHO Definition:** **FOG SIGNAL.** A warning signal transmitted by a vessel, or aid to navigation, during periods of low visibility. Also, the device producing such a signal. (IHO Dictionary – S-32).

### **S-401 Geo Feature:** Fog Signal (FOGSIG) (M)

#### **Primitives:** Point

† Complex attribute **feature name**, sub-attribute **name usage** is mandatory if the name is intended to be displayed when display of names is enabled by the boatmaster. See clause 2.5.8.

For each instance of **fixed date range**, at least one of the sub-attributes **date end** or **date start** must be populated.

For each instance of **information**, at least one of the sub-attributes **file reference** or **text** must be populated.

### 20.16.1 Fog signals

The term “fog signal” refers to the sound emitted, not the apparatus. Fog signals are short range aids to navigation, principally used as hazard warnings. For various reasons they are unreliable as indicators of position. Their importance relative to other aids to navigation has declined but they are still considered useful for the safe navigation of vessels with very limited (or non-functioning) electronic equipment. A fog signal should be shown on IENCs at an optimum display scale on which vessels may navigate within range.

The position from which a fog signal is emitted is usually on a buoy, or close enough to a light to be treated as sounded from the same position as the light.

If it is required to encode a fog signal, it must be done using the feature **Fog Signal**.

#### Remarks:

- The characteristic rhythm of fog signals (other than those actuated by waves, which are irregular) may be more important than their type when boatmasters are attempting to identify them. The number of sound emissions (for example blasts, strokes) and the period must therefore be encoded, where known, using the attributes **signal group**, **signal period** and **signal sequence**.
- Where required, the attribute **signal frequency** must be quoted in Hertz, for example a signal frequency of 950 MHz must be encoded as 950000000.
- If the fog signal is radio activated, the attribute **signal generation** must be populated with value 5 (radio activated). To encode the contact information for activation of the signal, it must be done using the information type **Contact Details** (see clause 24.1). The **Contact Details** must be associated to the **Fog Signal** feature using the association **Additional Information**.
- If the fog signal is activated by calling into a manned station, the attribute **signal generation** must be populated with value 6 (call activated). To encode the contact information for the manned station, it must be done using the information type **Contact Details**. The **Contact Details** must be associated to the **Fog Signal** feature using the association **Additional Information**.

Distinction: Signal Station Warning.

#### Inland specific Encoding Instructions:

- A) The name of the navigational aid must be encoded in the attribute **feature name** (OBJNAM) of the structure feature. It is not repeated for each equipment feature.
- B) The **signal group** (SIGGRP) is encoded using brackets to separate the individual groups. A group of signals may be a single number, a chain of numbers separated by "+", a sequence of up to 4 letters or a letter and a number.
- C) L in **signal sequence** (SIGSEQ) stands for signal duration in xx.x seconds. E stands for duration of silence in xx.x seconds.
